THIS PAGE LEFT INTENTIONALLY BLANK

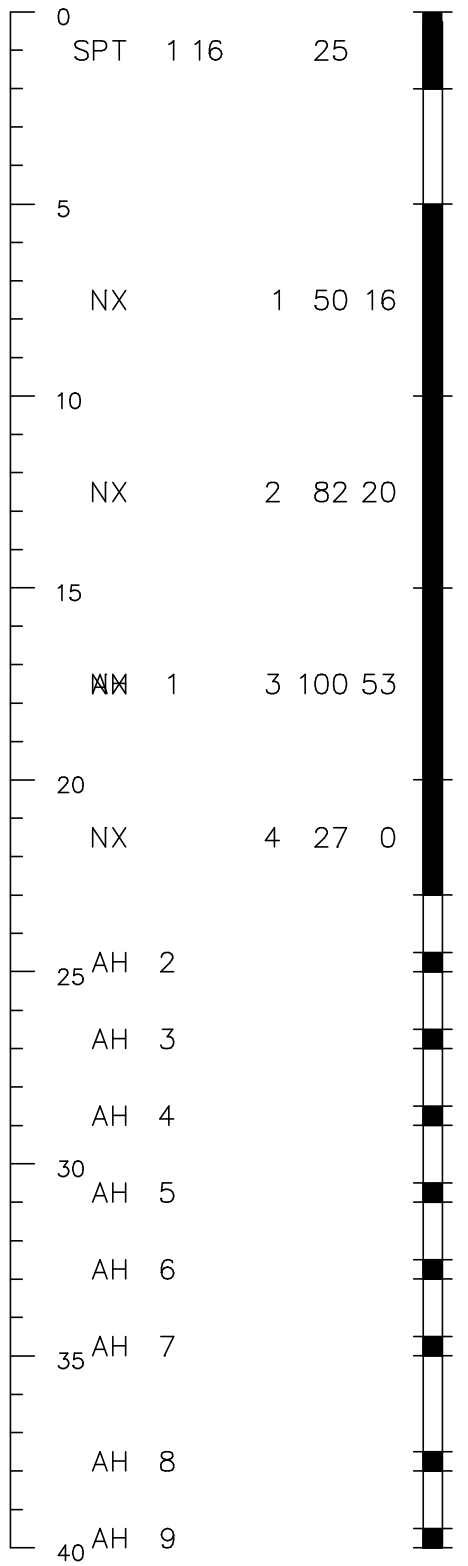
BORING 40MW1A

Surface Elevation: 0
Location: Radford AAP, Virginia
Start: 11:00 on 10-21-91
Finish: 10:53 on 10-22-91



Symbols	Description
CL	DARK YELLOWISH BROWN (10YR 4/6) SILTY CLAY, SLIGHT PLASTICITY, DRY
LS DS Shale	HIGHLY WEATHERED INTERBEDDED BLUISH GRAY AND BROWNISH GRAY DOLOSTONE AND RED SHALES, WITH FREQUENT ZONES OF CALCITE VEINS AND WEATHERED LIMESTONE SEAMS, MANY SEAMS WEATHERED TO CLAY
	DIPPING UP TO 20 DEGREES
	HIGHLY CLAYEY WITH BLACK MINERAL STAINING, SOFT
	GETTING HARDER CONTINUED HIGHLY FRACTURED DOLOSTONE, LIMESTONE AND SHALE, WITH MOST FRACTURES OCCURRING ALONG CLAY PARTINGS
	RED SHALE AND YELLOWISH BROWN LIMESTONE CONTENT INCREASING; BEDDING NEARLY HORIZONTAL
	CALCITE AND LIMESTONE SEAMS BECOMING PITTED
	VOID 21.5-23.0 FEET
	STOPPED CORING AT 23.0 FEET, DUE TO EXCESSIVE WATER LOSS AND POOR ROCK QUIALITY. SUBSEQUENT LOG OF BORING IS FROM ROCK CUTTINGS AND DRILLING CONDITIONS
	BROWNISH GRAY AND BLUISH GRAY LIMESTONE, INTERBEDDED WITH SILTY SHALES
	SAME, WITH SOME SOFT SILTSTONE SEAMS. SOME THIN CALCITE LAMINATIONS NOTED IN SOFT SILTSTONE CUTTINGS
	HIGHLY SILTY, CONTINUED INTERBEDDED DOLOSTONE LIMESTONE AND SHALE (SILTSTONE)
	GRADING HARDER

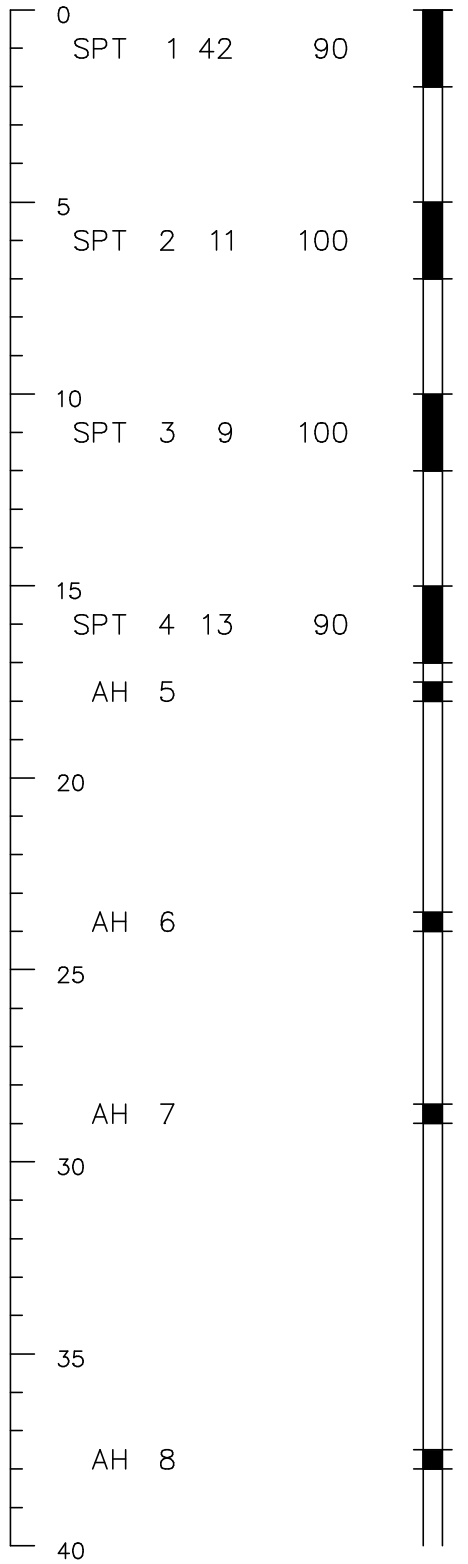
BORING 40MW2

Surface Elevation: 1881.1 Feet
Location: Radford AAP, Virginia
Start: 13:42 on 10-29-91
Finish: 11:00 on 10-30-91



Symbols	Description
ML	REDDISH YELLOW (7.5YR 5/8) SILTY CLAY, TRACE SAND, STIFF, DRY
	GRADED CONTACT
	YELLOWISH RED (5YR 5/8) CLAYEY SILT SLIGHTLY PLASTIC, SLIGHTLY MOIST
	WITH OCCASIONAL VERY FINE SANDY LENSES
ML	VERY MOIST, BECOMING SANDY
	THIN SILT SEAM, LIGHT YELLOWISH BROWN (2.5Y 6/4), STIFF, DRY, BRITTLE, FROM 16.5-17.0 FEET, OVERLYING BEDROCK
LS/DS/Shale	LIGHT BROWNISH GRAY (10YR 6/2) HIGHLY WEATHERED DOLOSTONE (SILTSTONE) DID NOT ATTEMPT NX ROCK CORING AT THIS LOCATION DUE TO THE POOR ROCK QUALITY AND EXCESSIVE WATER LOSSES AT BORINGS 40MW1A, 40MW3A, AND 40MW4. THIS BORING WAS LOGGED BY VISUAL OBSERVATION OF CUTTINGS SAMPLES COLLECTED WITH THE AIR HAMMER
	SOFT, FAST DRILLING
	GRAY (10YR 6/1) DOLOSTONE, HIGHLY WEATHERED, SOFT, WITH INTERBEDDED SEAMS OF WEATHERED SILTSTONE (PALE BROWN) AND LIMESTONE
	WITH SEAMS DARKER GRAY AND BLUISH GRAY DOLOMITE SEAMS
	BECOMING HARDER DOLOSTONE, WITH MORE OF THE BLUISH GRAY DOLOSTONE, AND SOME SOFT LIMESTONE SEAMS

FILE

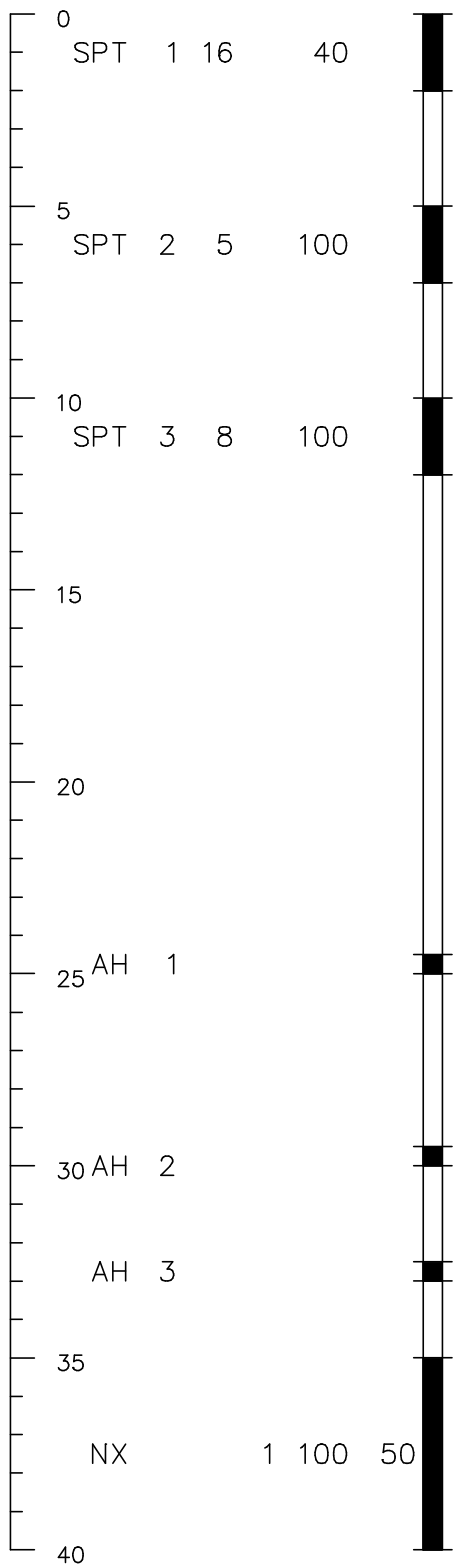
BORING 40MW4

Surface Elevation: 1906.1 Feet, MSL
Location: Radford AAP, Virginia
Start: 08:45 on 10-28-91
Finish: 08:59 on 10-29-91



Symbols	Description
ML	YELLOWISH BROWN (10YR 5/4) FINE SANDY SILT, OVERLAIN BY YELLOWISH BROWN CLAY WITH GRAY MOTTLING
	SLIGHTLY MOIST, WITH SOME FINE TO MEDIUM SAND, COHESIVE, SOFT
	GRADING MORE MOIST
	STRONG BROWN (10YR 5/6)
	WHITE (10YR 8/1) CLAY SEAM, VERY MOIST, OVERLYING ROCK AT 14.0 FEET
	ROCK IS HIGHLY WEATHERED
	ATTEMPT AT NX CORING AT THIS DEPTH WOULD PROBABLY RESULT IN EXCESSIVE WATER LOSS. BOREHOLE WAS THEREFORE REAMED WITH AN 8-INCH AIR HAMMER TO A DEPTH OF 35.0 FEET WHERE ROCK CORING WAS ATTEMPTED
	INTERBEDDED GRAY DOLOSTONE AND LIGHT BROWN (7.5YR 6/3) SILTSTONE AND LIMESTONE SEAMS
LS/DS Shale	CUTTINGS REPRESENT HIGHLY WEATHERED INTERBEDDED DOLOSTONE AND SILTSTONE LAYERS, OBUNDANT SILT
	GRAY (N/6) DOLOSTONE, GETTING HARDER
	BEGIN CORING AT 35.0 FEET
LS/DS	DOLOSTONE, PALE OLIVE (5Y 6/3) WITH THIN LIMESTONE SEAMS, WHICH ARE SLIGHTLY PITTED. BEDDING DIPS SLIGHTLY. SOME BLACK MINERAL STAINING AT FRACTURES, BLUISH GRAY FROM 36.1-36.7 FEET
	37.5-39.0 FEET ARE LIGHT RED (10YR 6/6) SEAMS OF DOLOSTONE
	39.0 FEET GRAY N/6 DOLOSTONE

Log of Borehole 71SB11

Sheet 1 of 1

Date(s) Drilled	**11/18/2002 11:35-12:45**	Logged By	**J. Spangler**	Reviewed By	**J. Spencer**
Drilling Method	**Geoprobe - Hydraulic Push/ 2-inch diameter Macrocore**	Drilling Contractor	**Richard Simmons Drilling Co., Inc.**	Total Depth of Borehole	**6.9 feet**
Drill Rig Type	**Tractor- mounted Geoprobe**	Drill Bit Size/Type	**2-inch Macrocore**	Ground Surface Elevation	**1906.8**
Groundwater Level(s)	**NA**	Sampling Method	**2-inch Macrocore**	Hammer Data	**NA**
Borehole Backfill	**Bentonite Pellets**	Comments			

Elevation, feet	Downhole Depth, feet	SAMPLES Type	SAMPLES Number	SAMPLES % Recovery	SAMPLES PID (ppm)	Graphic Log	Lithologic Log (USCS Code)	MATERIAL DESCRIPTION	FIELD NOTES
	0				ND		CL	10YR 3/2, very dark grayish brown, CLAY with crush & run, black cinders, moist	Sample 71SB11A collected from 0.2-0.95 ft bgs.
	1				ND		SM	2.5Y 3/1, very dark gray, fine SILTY SAND with gravel	
1905			1	100			FILL	Black cinders in SILTY SANDY GRAVEL matrix	Sample 71SB11F collected from 1.4-2 ft bgs.
	2				0.8		CL	10YR 5/6, yellowish brown, SILTY CLAY, hard, low plasticity	Sample 71SB11B collected from 2-4.5 ft bgs.
	3				0.2			Refusal at 3.3 feet bgs, offset 5 feet	
	4				ND		CL	10YR 5/6, strong brown, SILTY CLAY, stiff, medium plasticity, moist	
	5				ND				
	6				ND		ML	5Y 5/3, olive, fine SANDY SILT, hard, friable, moist	Sample 71SB11C collected from 6-6.9 ft bgs.
1900	7							Refusal, borehole terminated at 6.9 ft bgs

Key to Borehole Log

Sheet 1

Elevation feet	Downhole Depth, feet	SAMPLES Type	SAMPLES Number			Graphic Log	Lithologic Log (USCS Code)	MATERIAL DESCRIPTION	FIELD NOTES
1	2	3	4	5	6	7	8	9	10

COLUMN DESCRIPTIONS

1 **Elevation:** Elevation in feet referenced to mean sea level (MSL) or site datum.

2 **Downhole Depth:** Depth in feet below the ground surface.

3 **Sample Type:** Type of soil sample collected at depth interval shown; sampler symbols are explained below.

4 **Sample Number:** Sample identification number.

5 **Recovery:** Length of sample in inches recovered in continuous sampling interval; "NA" indicates data not recorded.

6 **PID:** Each Macrocore sample screened with Photo Ionization Detector in parts per million

7 **Graphic Log:** Graphic depiction of subsurface material encountered; typical symbols are explained below.

8 **USCS Code:** Unified Soil Classification System (USCS) group symbol code for associated soil strata.

9 **Material Description:** Description of material encountered; may include color, moisture, grain size, and density/consistency.

10 **Field Notes:** Observations regarding drilling or sampling made by driller or field personnel.

TYPICAL SOIL GRAPHIC SYMBOLS

CLAYEY SAND

Poorly graded GRAVEL

FILL

Low Plasticity CLAY

Well graded SAND

High Plasticity CLAY

SILT

SILTY SAND

TYPICAL SAMPLER GRAPHIC SYMBOLS

Macrocore Sample

OTHER GRAPHIC SYMBOLS

Water level observed during drilling

Key to Log of Test Pit

Elevation feet	Depth, feet	Sample Type	Sample Number	Graphic Log	Lithologic Log (USCS Code)	MATERIAL DESCRIPTION	Water Content	REMARKS AND OTHER TESTS
1	2	3	4	5	6	7	8	9

COLUMN DESCRIPTIONS

1 **Elevation:** Elevation in feet referenced to mean sea level (MSL) or site datum.

2 **Depth:** Depth in feet below the ground surface.

3 **Sample Type:** Type of soil sample collected at depth interval shown; sampler symbols are explained below.

4 **Sample Number:** Sample identification number.

5 **Graphic Log:** Graphic depiction of subsurface material encountered; typical symbols are explained below.

6 **Lithologic Log:** USCS Code symbols for soils.

7 **Material Description:** Description of material encountered; may include color, moisture, grain size, and density/consistency.

8

9 **Remarks and Other Tests:** Comments and observations regarding excavation or sampling made by driller or field personnel. Field and laboratory test results (other than water content), using abbreviations explained below.

TYPICAL MATERIAL GRAPHIC SYMBOLS

CLAYEY SAND

Poorly graded GRAVEL

FILL

Low Plasticity CLAY

Well graded SAND

Well graded SAND with CLAY

TYPICAL SAMPLER GRAPHIC SYMBOLS

Grab Sample

OTHER GRAPHIC SYMBOLS

TYPICAL LABORATORY TEST ABBREVIATIONS

Soil classifications are based on the Unified Soil Classification System. Descriptions and stratum lines are interpretive; field descriptions may have been modified to reflect lab test results. Descriptions on these logs apply only at the specific test pit locations and at the time the test pits were excavated; they are not warranted to be representative of subsurface conditions at other locations or times.

MONITORING WELL INSPECTION LOG

PROJECT NAME: SWMU 40 Groundwater Investigation

URS PROJECT NO. ~~21354~~ 21354880.10001

FACILITY NAME: RFAAP

MONITORING WELL: 40MW2

A. Inspected by (full name): Jim Carter

B. Date/Time of Inspection: 7-31-07 1440

C. Inspection Observations:

1. Locking protective casing:
   Rusty but overall good.
2. Concrete well Pad:
   Good
3. Lock:
   no lock - new lock placed on well on 8/1/07
4. Erosion:
   None observed
5. Exterior well identification number:
   worn but readable

D. Inspection Comments:

GROUNDWATER WELL DEVELOPMENT FIELD LOG

Project Information

Project Name:	SWMU 40 Groundwater Invest.	Date:	8/1/07
Facility Name:	RFAAP	Client:	ATK
URS Project No.:	21354880.10001	Sampling Event:	
Weather Conditions:	Overcast, ~85°F		
Development Team:	CF, JE		

Monitoring Well ID and Measurement Information

Monitoring Well ID:	40MW5	Organic Vapor Headspace:	2.4 ppm
Time Well Casing Unlocked:	1150	Combustible Gas:	%LEL
Well Stickup from Ground Surface (Inner Casing):	0.875 ft		
Well Stickup from Ground Surface (Outer Casing):	1.021 ft	Height of Water H_w [a-b]	57.76 ft
Depth to Water Top of Inner/outer casing:[a]	100.60 ft		
Depth to Immiscible Layer	NA ft	Measurement Technique:	
Thickness of Immiscible Layer	NA ft	Electronic water level meter	
Total Depth of Well From top of Inner/Outer Casing [b]:	158.36 ft	accurate to 1/100'	

Well Construction and Purge Volume Calculation

Screened Well [ ]

Boring Radius (r_b)	0.75	ft
Nominal Radius of Casing (r_c)	0.083	ft
Height of Sand Pack (h_s)	26	ft
Length of Screen	20	ft

Formulas for Determining Purge Volume

Water Level above Top of Sand Pack

$3 \times [\pi r_b^2 h_s - \pi r_c^2 h_s) \times 0.3 + (\pi r_c^2 h_w) \times 7.5] =$ 59.4 gals

Water Level below Top of Sand Pack

$3 \times [\pi r_b^2 h_w - \pi r_c^2 h_w) \times 0.3 + (\pi r_c^2 h_w) \times 7.5] =$ _____ gals

where:

r_b = radius of boring		ft
r_c = radius of casing		ft
h_s = height of sand		ft
h_w = height of water		ft
r_b = radius of boring		ft
r_c = radius of casing		ft
h_s = height of sand		ft
h_w = height of water		ft

Purge/Sampling Technique:

High Flow-Volume Purge/Low Flow Sampling: [ ]

Low Flow Purge/Low Flow Sampling: [ ]

Other: High Flow purge

Open Bedrock Well [ ]

Radius of Open Borehole (r_b)	ft
Depth to Bottom of Overburden Casing	ft
Depth to Bottom of Well	ft
Length of Well Open to Bedrock	ft

Formula for Determining Purge Volume:

$3 \times [(\pi r_b^2 h_w) \times 7.5] =$ _____ gals

where:

r_b = radius of boring	ft
h_w = height of water	ft
r_b = radius of boring	ft
h_w = height of water	ft

Well Development Equipment

Surge Block	[X]	[ ]

THIS PAGE LEFT INTENTIONALLY BLANK

MONITORING WELL INSPECTION LOG

PROJECT NAME: SWMU 40 Groundwater Investigation

URS PROJECT NO. 21354880-10001

FACILITY NAME: RFAAP

MONITORING WELL: 17MW3

A. Inspected by (full name): Jim Carter

B. Date/Time of Inspection: 08/13/07 14:30

C. Inspection Observations:

1. Locking protective casing:
   Paint is peeling, slightly rusted but overall in decent condition.
2. Concrete well Pad:
   Fair condition - not broken or cracked
3. Lock:
   rusty but functional
4. Erosion:
   None observed
5. Exterior well identification number:
   Inside cap - difficult ~~too~~ to read. No number on the exterior

D. Inspection Comments:

MONITORING WELL INSPECTION LOG

E. Repair/remediation comments:

New number needed on exterior of well.
Although the lock is functional, a new lock is recommended.
NO WELL CAP

F. Repair/remediation Date: _____

27.5 - 3

Set pump on bottom, then pulled up ~8-9 ft.

MONITORING WELL INSPECTION LOG

PROJECT NAME: SWMU 40 Groundwater Investigation

URS PROJECT NO. 21354880.10001

FACILITY NAME: RFAAP

MONITORING WELL: 40 MW6

A. Inspected by (full name): Jim Carter

B. Date/Time of Inspection: 08/14/07 / 17:15

C. Inspection Observations:

1. Locking protective casing:
   New
2. Concrete well Pad:
   New
3. Lock:
   New
4. Erosion:
   NONE
5. Exterior well identification number:
   NEW

D. Inspection Comments:

MONITORING WELL INSPECTION LOG

E. Repair/remediation comments:

_____

_____

_____

_____

F. Repair/remediation Date: _____

Pump should be placed at 122 ft (water + flow bgs) + 19" (casing height above ground) ≈ 124 ft btoc

GROUNDWATER SAMPLING FIELD LOG

Project Information

Project Name:	SWMU40 GW Investigation	Date:	08/14/07
Facility Name:	RFAAP	Client:	ATK/RFAAP
URS Project No.:	21354880.10001	Sampling Event:	
Weather Conditions:	Clear, ~85°F (17:15)		
Sampling Team:	CF, JC		

Monitoring Well ID and Measurement Information

Monitoring Well ID:	40MW6	Organic Vapor Headspace:	1.5 ppm
Time Well Casing Unlocked:	17:19	Combustible Gas:	%LEL
Well Stickup from Ground Surface (Inner Casing):	19" ft		
Well Stickup from Ground Surface (Outer Casing):	21.75" ft	Height of Water H_w [a-b]	42.11 ft
Depth to Water Top of (Inner)/outer casing:[a]	~~19"~~ 94.89 ft		
Depth to Immiscible Layer	NA ft	Measurement Technique:	
Thickness of Immiscible Layer	NA ft		
Total Depth of Well From top of Inner/Outer Casing [b]:	136.70 ft		

Well Construction and Purge Volume Calculation

Screened Well [✓]

Boring Radius (r_b)	0.25	ft
Nominal Radius of Casing (r_c)	0.083	ft
Height of Sand Pack (h_s)	26	ft
Length of Screen	20	ft

Formulas for Determining Purge Volume

Water Level above Top of Sand Pack

$3 \times [\pi r_b^2 h_s - \pi r_c^2 h_s) \times 0.3 + (\pi r_c^2 h_w) \times 7.5] =$ _____ gals

Water Level below Top of Sand Pack

$3 \times [\pi r_b^2 h_w - \pi r_c^2 h_w) \times 0.3 + (\pi r_c^2 h_w) \times 7.5] =$ _____ gals

where:

r_b = radius of boring		ft
r_c = radius of casing		ft
h_s = height of sand		ft
h_w = height of water		ft
r_b = radius of boring		ft
r_c = radius of casing		ft
h_s = height of sand		ft
h_w = height of water		ft

Purge/Sampling Technique:

High Flow-Volume Purge/Low Flow Sampling: [✓]

Low Flow Purge/Low Flow Sampling: [ ]

Other:

Open Bedrock Well [ ]

Radius of Open Borehole (r_b)	ft
Depth to Bottom of Overburden Casing	ft
Depth to Bottom of Well	ft
Length of Well Open to Bedrock	ft

Formula for Determining Purge Volume:

$3 \times [(\pi r_b^2 h_w) \times 7.5] =$ _____ gals

where:

r_b = radius of boring		ft
h_w = height of water		ft
r_b = radius of boring		ft
h_w = height of water		ft

Purge Equipment

Dedicated Bladder Pump:	[ ]	Dedicated Bailer:	[ ]
Dedicated Submersible Pump:	[ ]	Disposable Bailer:	[ ]
Submersible Pump: Grundfos	[✓]		[ ]
Peristaltic Pump:	[ ]		[ ]

$((\pi \times 0.25^2 \times 26) - (\pi \times 0.083^2 \times 26)) \times 0.3 + (\pi \times 0.083^2 \times 42.11)) \times 7.5$

$((5.11 - 0.56) \times 0.3 + (0.91)) \times 7.5$

$(1.365 + 0.91) \times ~~0.7~~ 7.5 = (2.275) \times 7.5 = 17.1$

3 vol = 51.19 gal

Started pump at 17:56
Purged ~54 gallons

5128	10,887,955.54	3,594,955.28	0.00

Notes:

The coordinates are in a raised project coordinate system which has been adjusted by a combined scale and elevation factor of 1.00013. Division of coordinate values by that factor will yield Virginia state plane coordinates, NAD 83 values. The U.S. survey foot was used in the conversion from metric to English units.

May 2001

Introduction

On May 1st-6th, 2001, Geophex Services, Ltd. conducted geophysical surveys at SWMU 40/71 at the Radford Army Arsenal near Radford, VA (Figure 1). The geophysical surveys utilized magnetic, electromagnetic induction, geophysical logging and DC resistivity methods. The objective was to determine the vertical and lateral extent of abandoned landfills present on-site.

Figure 1. View over a portion of SWMU 40/71 survey area, Radford, VA

All data were collected over an area totaling ~ 220,000 sq. feet (~ 5.4 acres). Figure 2 displays a generalized site map of the SWMU 40/71 geophysical survey. All accessible parts of the sites were surveyed on parallel tracklines spaced at intervals of five feet. After analysis of the EM and magnetic data to determine the lateral extent of the landfills, eight DC resistivity profiles were collected at various orientations to highlight the landfill depth and provide information about the underlying bedrock. These data were combined with natural gamma and electromagnetic induction logs collected in wells 40MW2 and 40MW4.

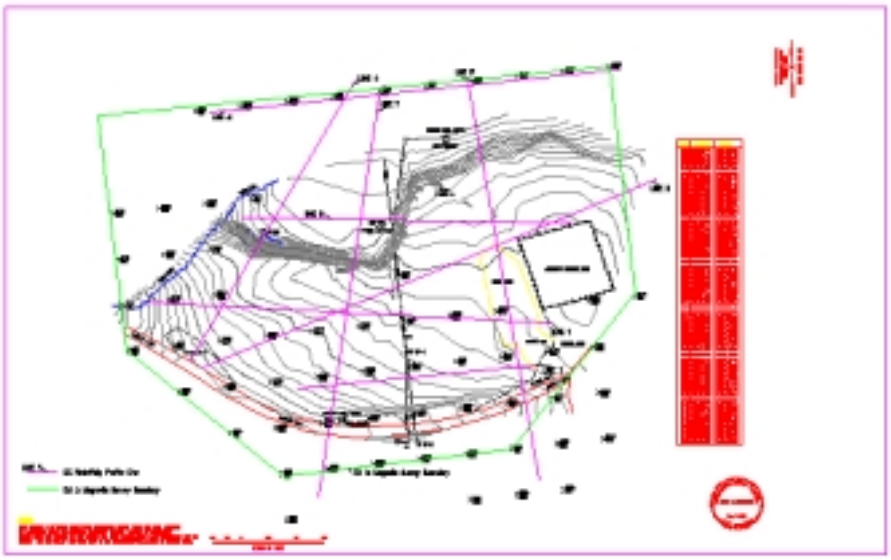

Figure 2. Site map of the geophysical surveys at SWMU 40/71 (see Appendix F for a larger version)

Geophysical Survey Instruments and Acquisition

Geophex acquired electromagnetic data using the GEM-2 sensor (Figure 3). The GEM-2 is an unique, hand-held, digital, broadband EM sensor that was developed at Geophex. The sensor exploits the relationship between electric fields, magnetic fields, and electrical current to detect changes in subsurface conductivity. Electrical conductivity is an inherent property of a material to conduct electrical current and can be used to characterize near-surface geological material efficiently (see Appendix A for additional information). Geophex acquired magnetic data using a cesium-vapor magnetometer, Model G-858 (manufactured by Geometrics) in a vertical gradient configuration (Figure 4). Magnetic surveys identify local deviations in the Earth's magnetic field. These local deviations result from targets that possess high magnetic susceptibilities, such as steel or other iron-bearing materials (see Appendix B for more information). For areas containing numerous metallic objects, the vertical gradient displays improved resolution of multiple targets, and small nearby objects are more accurately detected by reducing survey noise.

Figure 3. GEM-2 electromagnetic induction sensor

Figure 4. G-858 magnetometer in vertical gradient configuration

Following each survey, data were downloaded to a laptop computer in the field for immediate processing. We assigned spatial (i.e., x-y) coordinates to each sensor reading using standard dead-reckoning procedures. We imported the located data into Surfer© (Version 7.0) to produce color contour plots of each data set for inspection. Final locations of the geophysical survey were determined using a differentially corrected global positioning system (DGPS). The DGPS data were obtained using a Trimble survey-grade GPS receiver and post-processed to produce the site map and subsequent data maps. NAD 1983 and Virginia state plane (south) coordinates were used for these displays.

After analysis of the EM and magnetic data to identify the lateral extent of the landfill, a Sting multielectrode DC resistivity system (manufactured SAGA, Inc.) was used to determine the landfill depth (Figure 5). Resistivity can be defined as the observation of electric fields resulting from a current induced into the ground. Resistivity is the property of a material that resists the flow of electrical current (see Appendix C for more information).

The instrument consists of 28 electrodes in a linear array. Electrode spacing varied for the lines according to the azimuth of the profile and available space between cultural features (roads, fences, etc.). Table 1 lists the electrode spacing used for the profiles at SWMU 40/71. All data were acquired using a dipole-dipole configuration.

Table 1. Electrode spacing for resistivity lines acquired at SWMU 40/71.

6 m (19.7 ft.)	5 m (16.4 ft.)	4 m (13.1 ft.)	3 m (9.9 ft.)
Line 3	Line 1 Line 6 Line 7 Line 8	Line 4 Line 5	Line 2

The cable relays were attached to the electrode by use of a rubber band (Figure 6). The surface resistance of each electrode must be less than 2000 Ohms for this technique. To reduce surface resistances, electrodes were treated with salt water prior to data acquisition on each profile.

Figure 5. Sting DC resistivity system

Figure 6. Resistivity electrode during acquisition

The Sting/Swift system required approximately 50 minutes to record resistivity across the entire 28-electrode array. Data were transferred from the Sting earth resistivity meter to a laptop PC in the field. Data were processed by accompanying software that produces 2D resistivity cross-sections.

Geophysical well logs were collected in well 40MW2 (Figure 7) and well 40MW4. The log suite consists of natural gamma and electromagnetic induction (EM) logs for each well. The natural gamma sensor measures the gamma photons that originate from the radioactive decay of naturally occurring isotopes of Potassium-40 and daughter products of Uranium-238 and Thorium-232. Natural Gamma logs are commonly used to determine the clay content of the formation surrounding the borehole. An increase in gamma counts per second typically indicates a higher percentage of clay. EM logs reflect the amount of increased pore fluid/clay present within the section. A greater amount of pore fluid or clay will show an increased conductivity. Both wells consisted of 4 in. diameter PVC casing and were dry throughout the entire depth (56 ft. for 40MW2 and 62 ft. for 40 MW4). EM logs are displayed as conductivity (mS/m) and resistivity (ohm-m), while the natural gamma logs are displayed in counts per second (CPS).

Figure 7. Well 40MW2 at SWMU 40/71

Instrument calibration and QA/QC

QA/QC and calibration of geophysical instrumentation used at SWMU 40/71 were accomplished by a combination of pre-site calibration, on-site calibration, and on-site repeatability checks. Table 2 is a list of instruments and the QA/QC and calibration implemented. All QA/QC figures are displayed in Appendix D. All instruments performed well during the SWMU 40/71 surveys.

Table 2. Calibration and QA/QC for geophysical instruments at SWMU 40/71

Instrument/Tool	Calibration	QA/QC Technique
Surface EM (GEM-2)	Pre-site-ferrite rod calibration	Trackline repeat
Surface Magnetics (G-858)	NA	Trackline repeat
Surface Resistivity (Sting)	On-site resistance—19.92 ohm	Profile repeat –Line 2
Borehole Gamma (Mt. Sopris)	On-site calibration jig	Repeat run in both wells

Borehole EM (Geonics)	Pre-site and free-air on-site	Repeat run in both wells

Data Results

Logging results are displayed in Figure 8 for well 40MW2. The gamma log displays three bulk zones (0'-28', 28'-49', and > 49'). Drilling logs indicate the upper zone is silt and silty-clay associated with the local soils. The second zone is described as the bedrock dolomite. According to drilling logs, the dolomite contains "soft" and "hard" zones and lenses of clay/silt and limestone. The logs indicate the zone of most competent dolomite from 40' to 45'. The third zone identifies a rock unit described as clays and silts. Increased conductivity is measured at each of these major transitions. Since this well was dry and predominantly dolomite, the conductivity is an indirect indication of the formation porosity at any given depth. In turn, the formation porosity may infer zones where lithologic properties change (e.g. a clay lens within the dolomite at 25', "soft" dolomite vs. "hard" dolomite transition at 37', etc.).

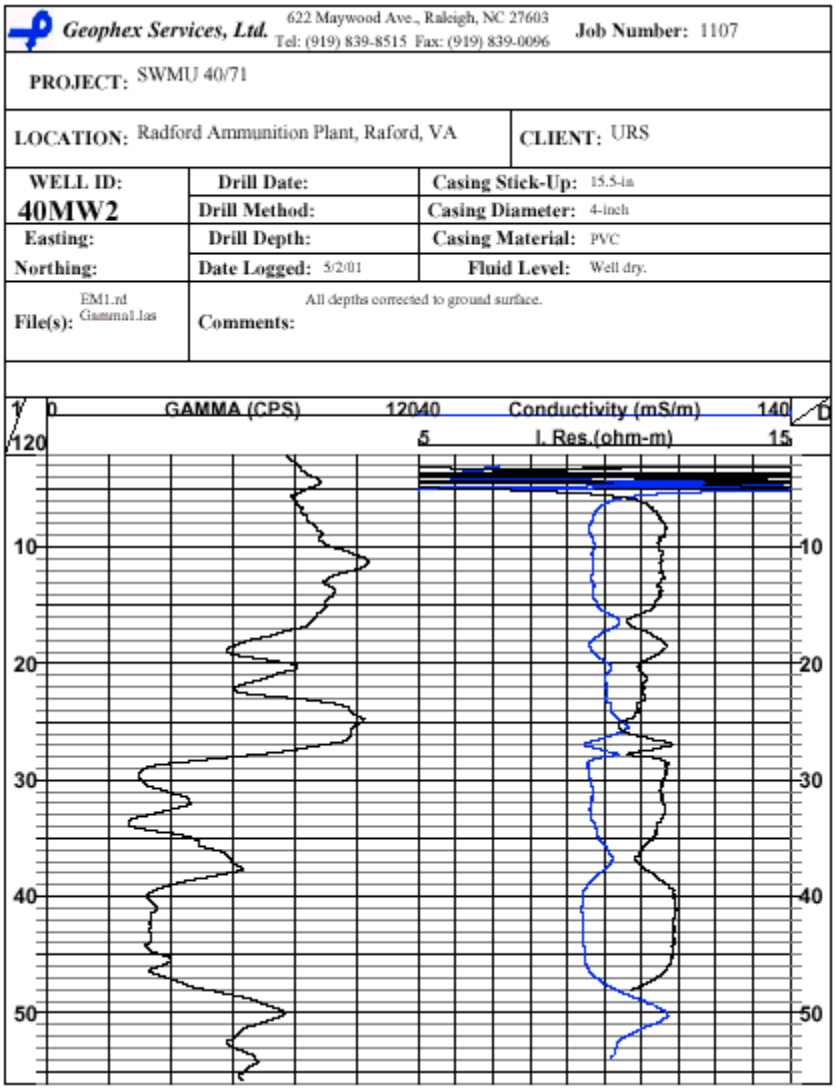

Figure 8. Well logs for well 40MW2

The 40MW4 gamma log displays two bulk zones (0'-30', and > 30') in Figure 9. Drilling logs list the upper zone to be silt and silty-clay associated with the local soils. The lower zone is described as bedrock dolomite. The dolomite contains zones referred to as "soft" or "hard". Additionally, limestone seams were noted within this unit. The largest gamma fluctuation at 34' depth is described as a clay zone, or well-cemented thin limestone (high clay content) seams. Gamma fluctuations from 40'-60' are inferred to represent additional seams of clay, or limestone within the bulk dolomite.

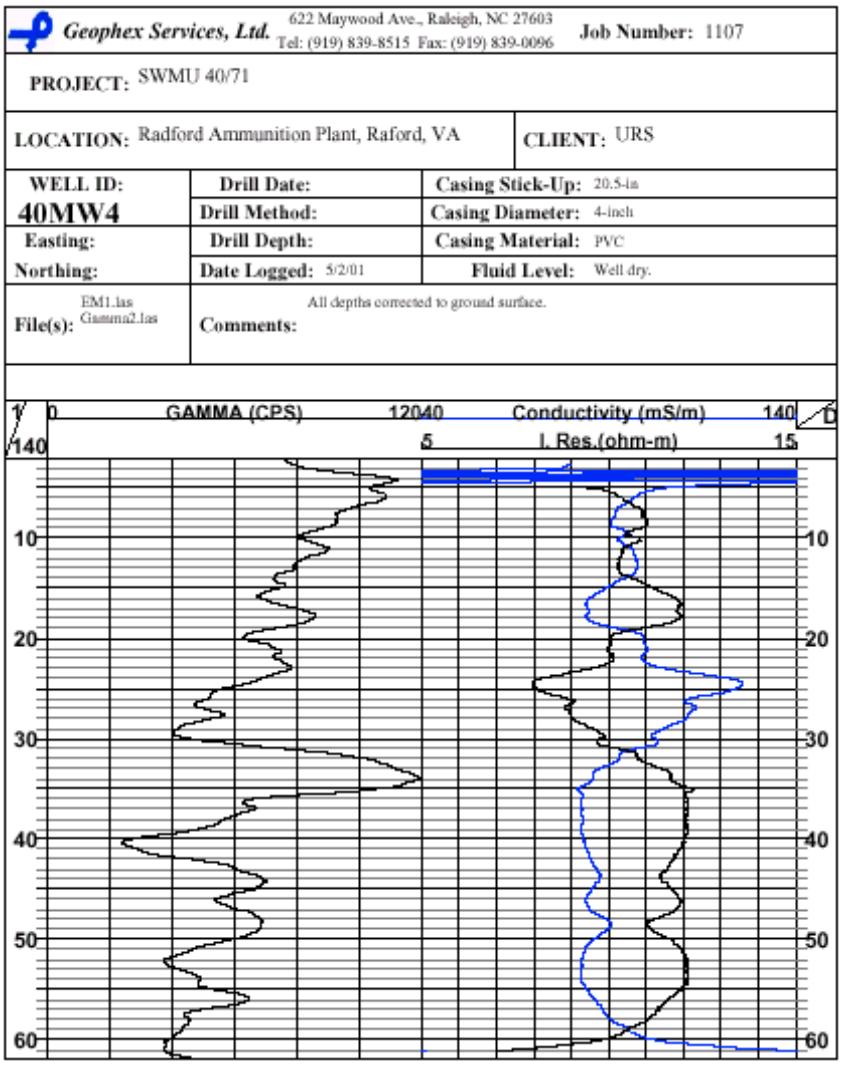

Figure 9. Well logs for well 40MW4

Electromagnetic and magnetic results are displayed in Figures 10 and 11 for the site. Inphase EM results are shown for a frequency of 1,050 Hertz. These results reveal the outline of the waste/burial area, which consists of a large concentration of buried metallic objects. The outline of the waste area is indicated on the figures and the one large negative anomaly (blue in color) in the north half of the interpreted waste area is indicative of a large concentration of ferrous material. The smaller negative anomaly in the south half of the interpretative waste area also is indicative of an accumulation of buried ferrous material. It is not possible with these data to distinguish the identity of these objects beyond the fact that they are metallic. The vertical magnetic gradient data also indicates large concentrations of ferrous metals on this site (Figure 11). The isolated anomalies (especially in the "Backfill" area in the toe of the hill-slope) having a dipole signature (a negative peak (blue in color) and a positive peak (red in color)) represent rusted scrap metal similar to that seen in Figure 12.

Figure 12. Photo of surface scrap metal at SWMU 40/71

Apparent conductivity calculated from the 4,170 Hz EM data is shown in Figure 13. These data outline both the waste and backfill areas. High apparent conductivity defines the waste area (yellow-red colors). As with the 1,050 inphase data, the data appear to highlight two trench-like features. Both of these contain the highest apparent conductivities in the dataset.

Resistivity profiles show the SWMU 40/71 waste area to be less resistive than the surrounding bedrock. Figures 14 and 15 display Lines 7 and 8, respectively. All resistivity profiles are displayed in a larger format in Appendix E. These lines are perpendicular to the major axis of the waste area (refer to Figure 2 or Appendix F for resistivity line locations). Line 7 highlights a maximum burial depth of approximately 65 feet. Line 8 shows a slightly different burial geometry. Maximum depth of the waste area in line 8 is approximately 50 feet. Also, Line 8 crosses the backfilled area (i.e. soil and rock fill area). Although not as conductive as the waste area, this material is still more electrically conductive than the underlying bedrock. Waste and burial area depths are indicated on the profiles in Appendix E.

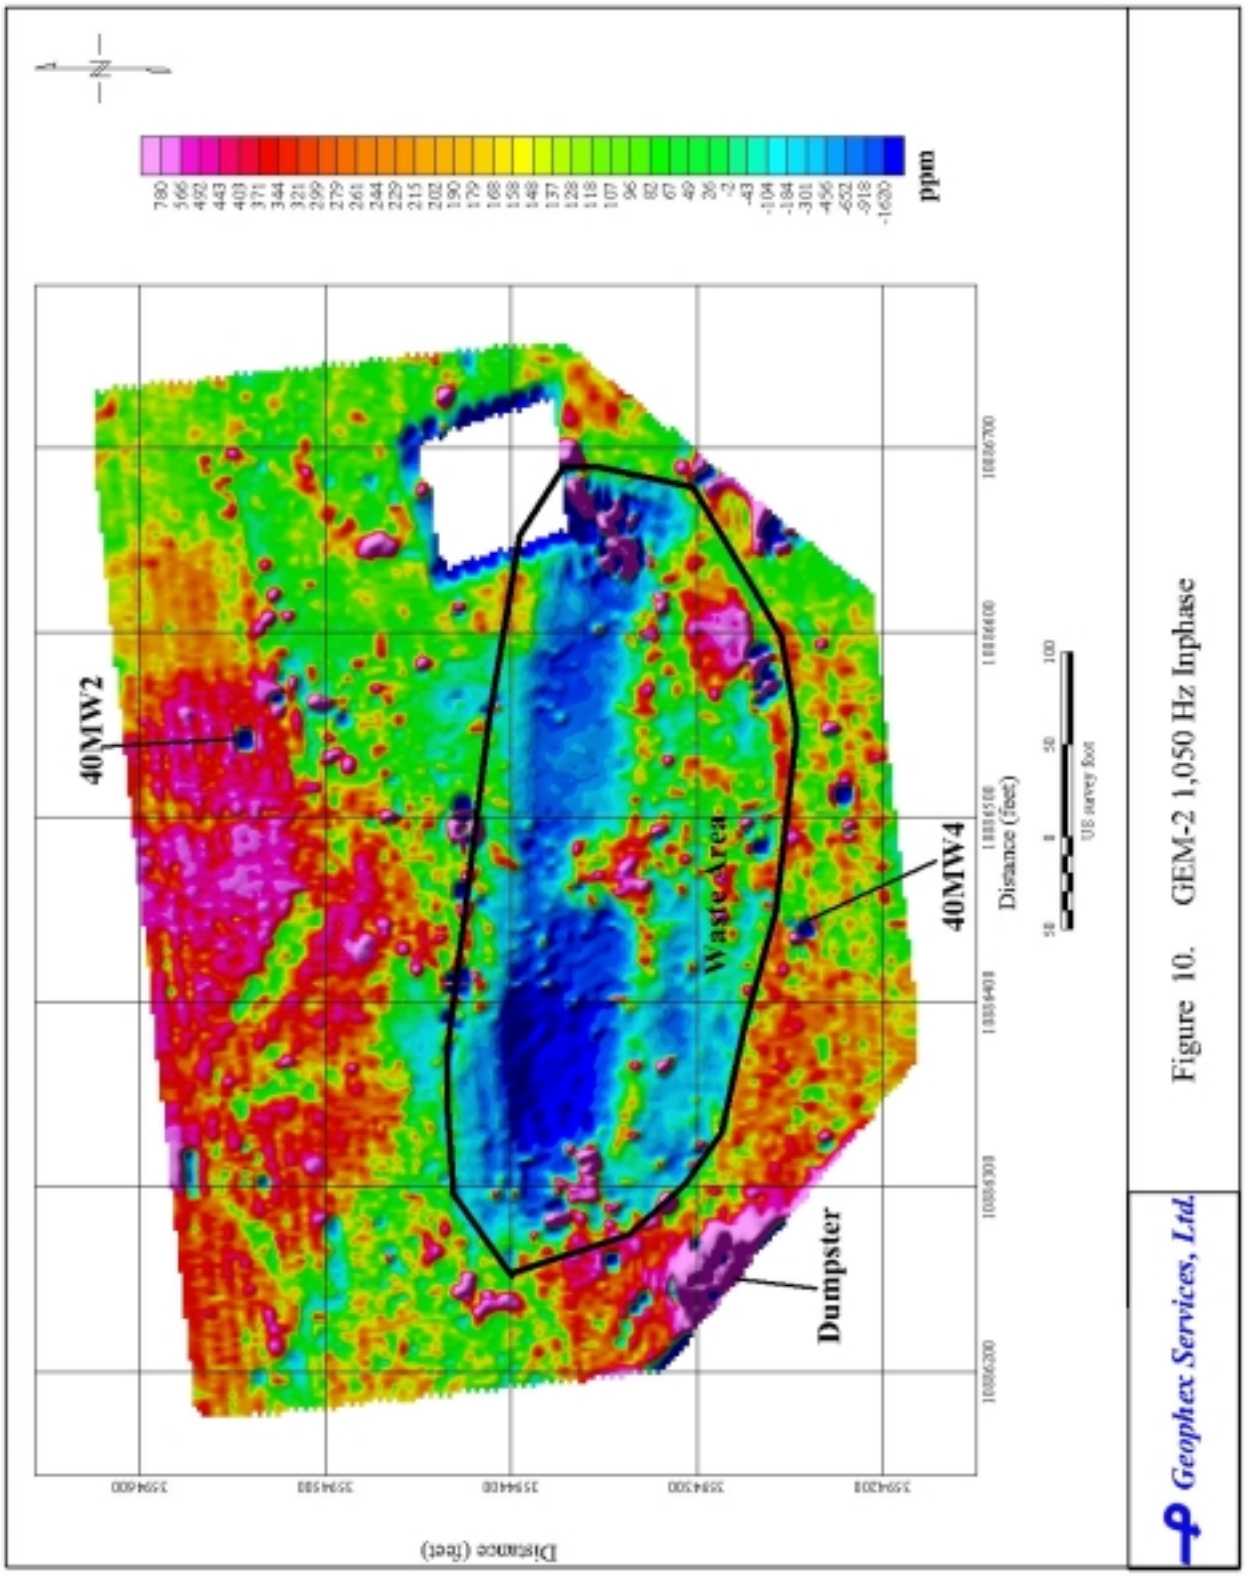

Figure 10. GEM-2 1,050 Hz Inphase

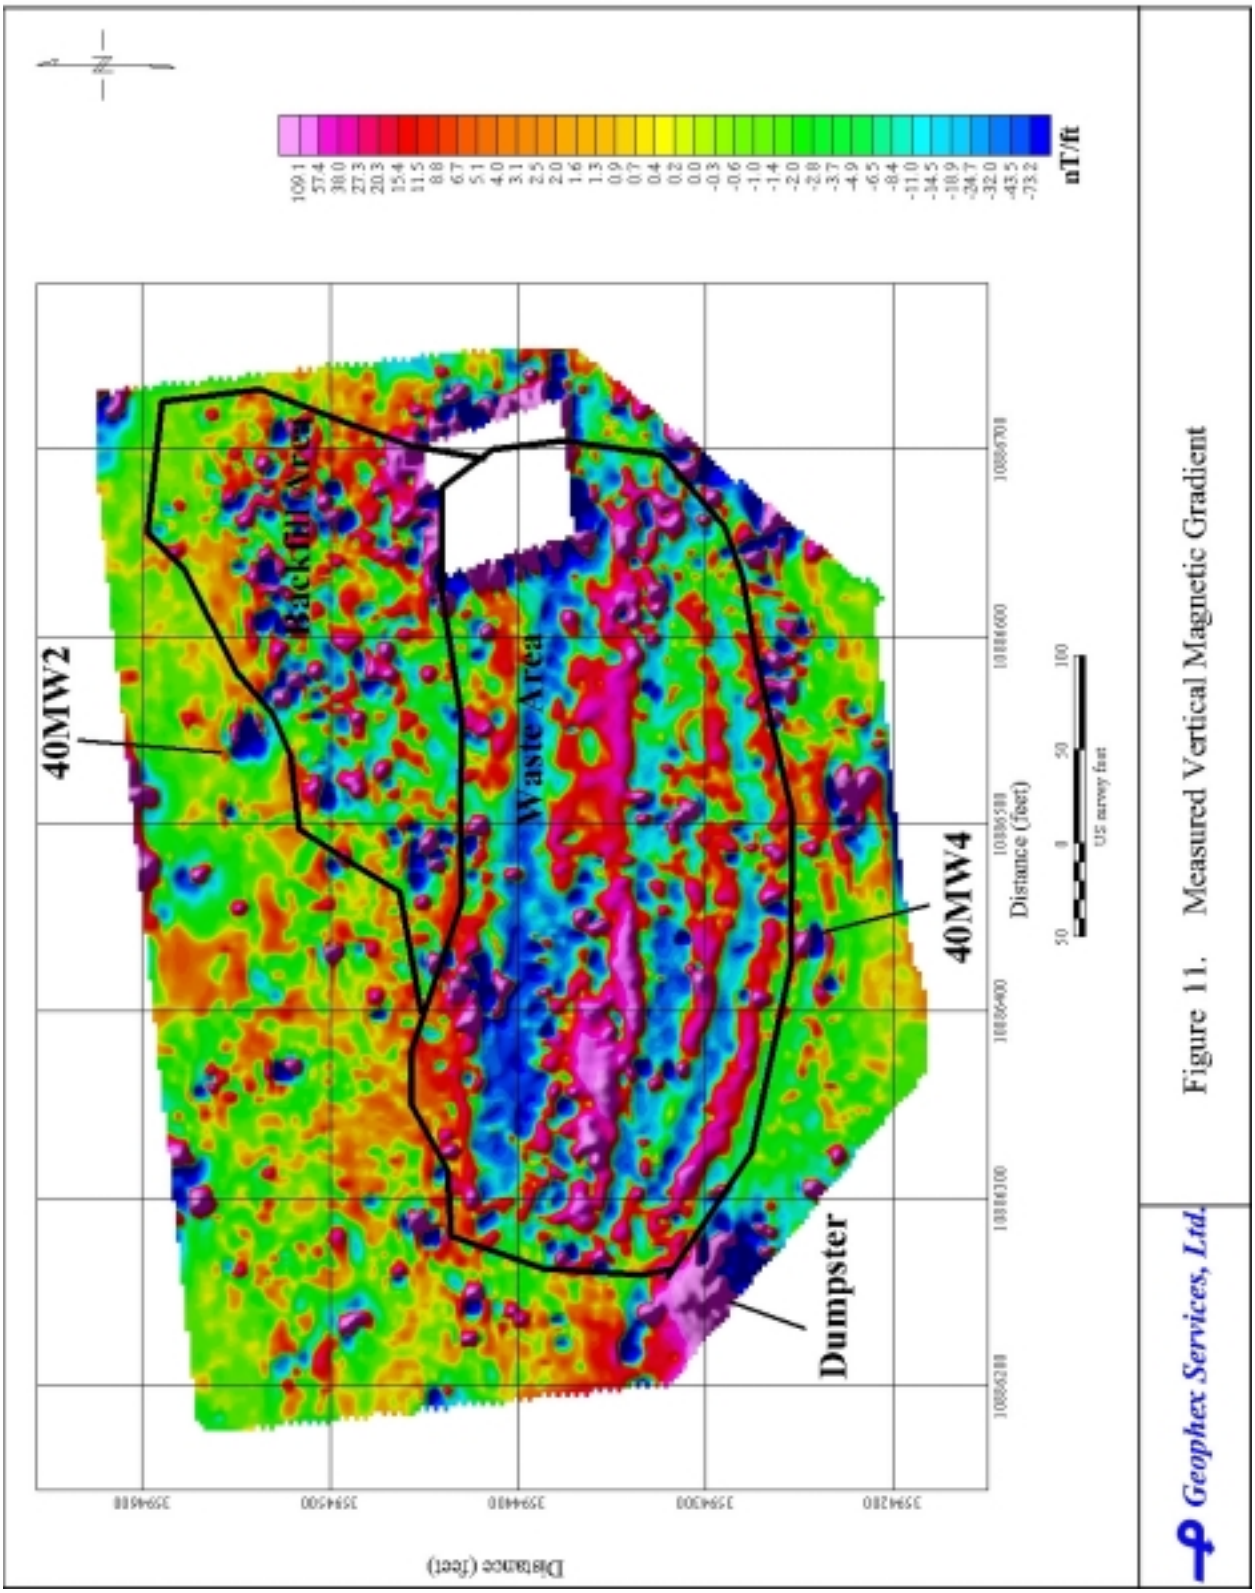

Figure 11. Measured Vertical Magnetic Gradient

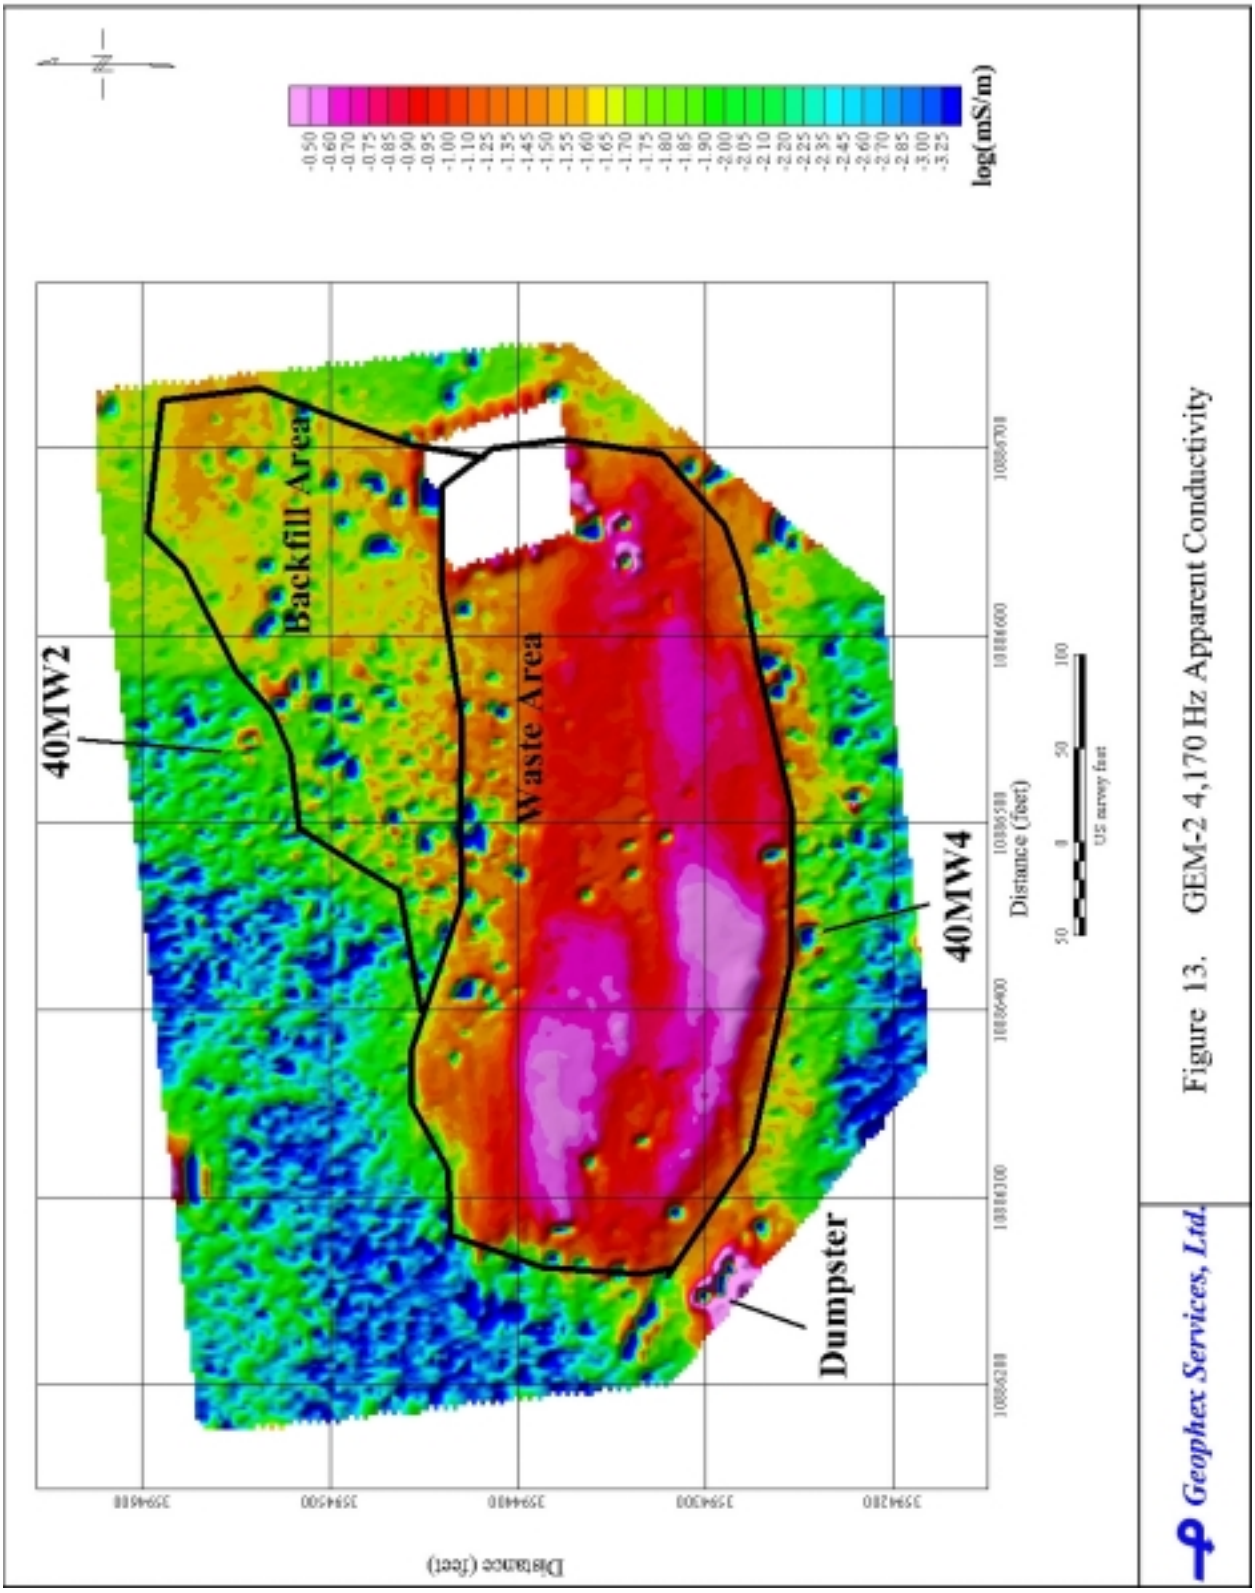

Figure 13. GEM-2 4,170 Hz Apparent Conductivity

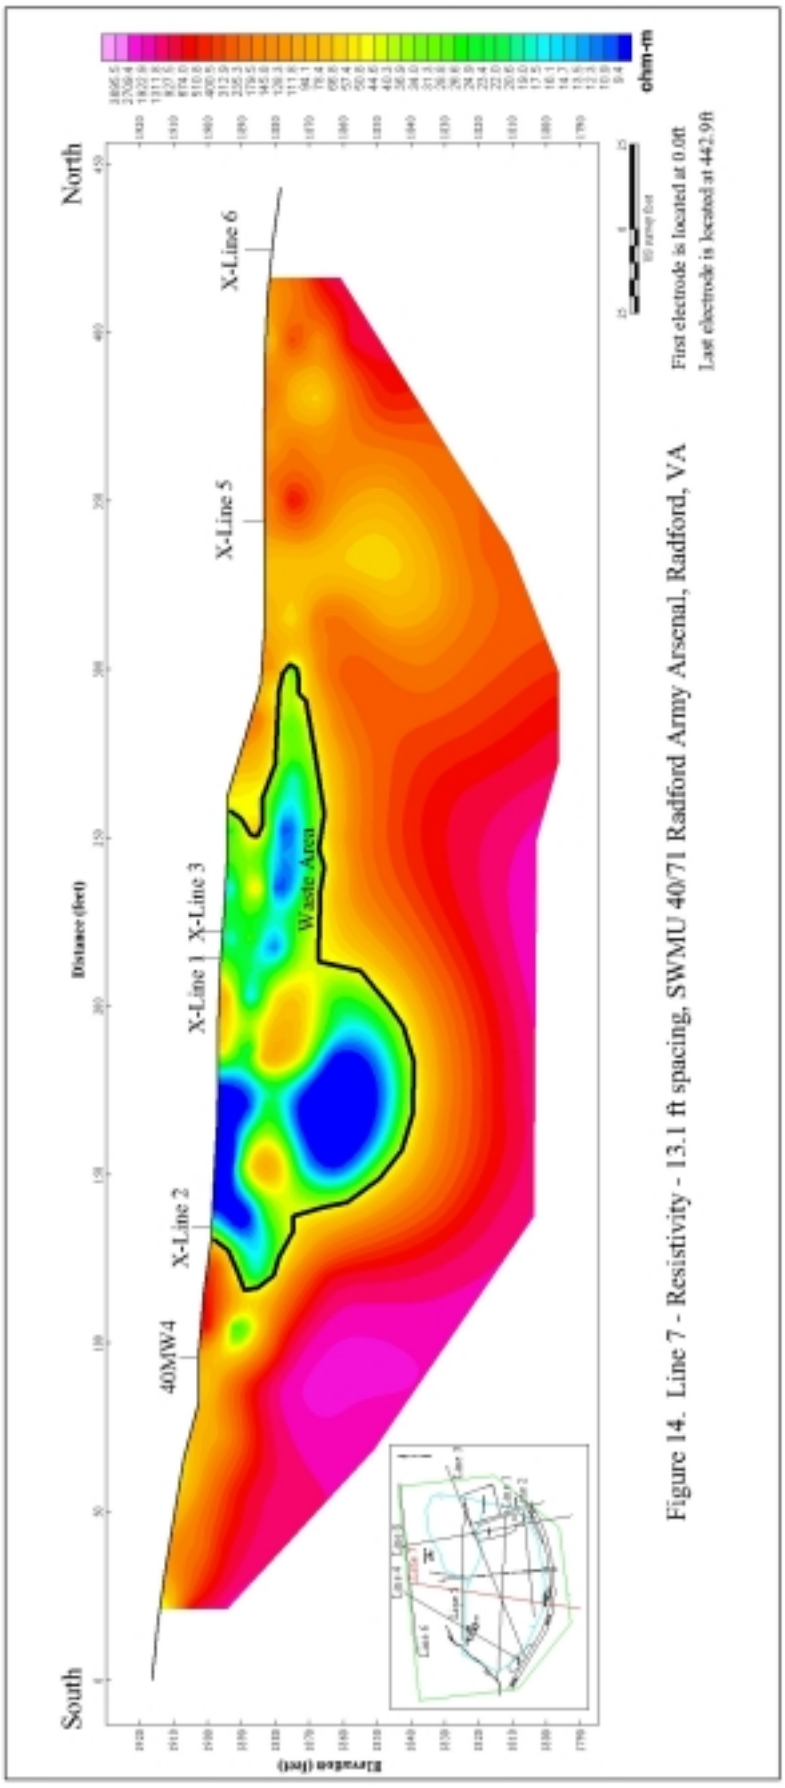

Figure 14. Line 7 - Resistivity - 13.1 ft spacing, SWMU 40/71 Radford Army Arsenal, Radford, VA

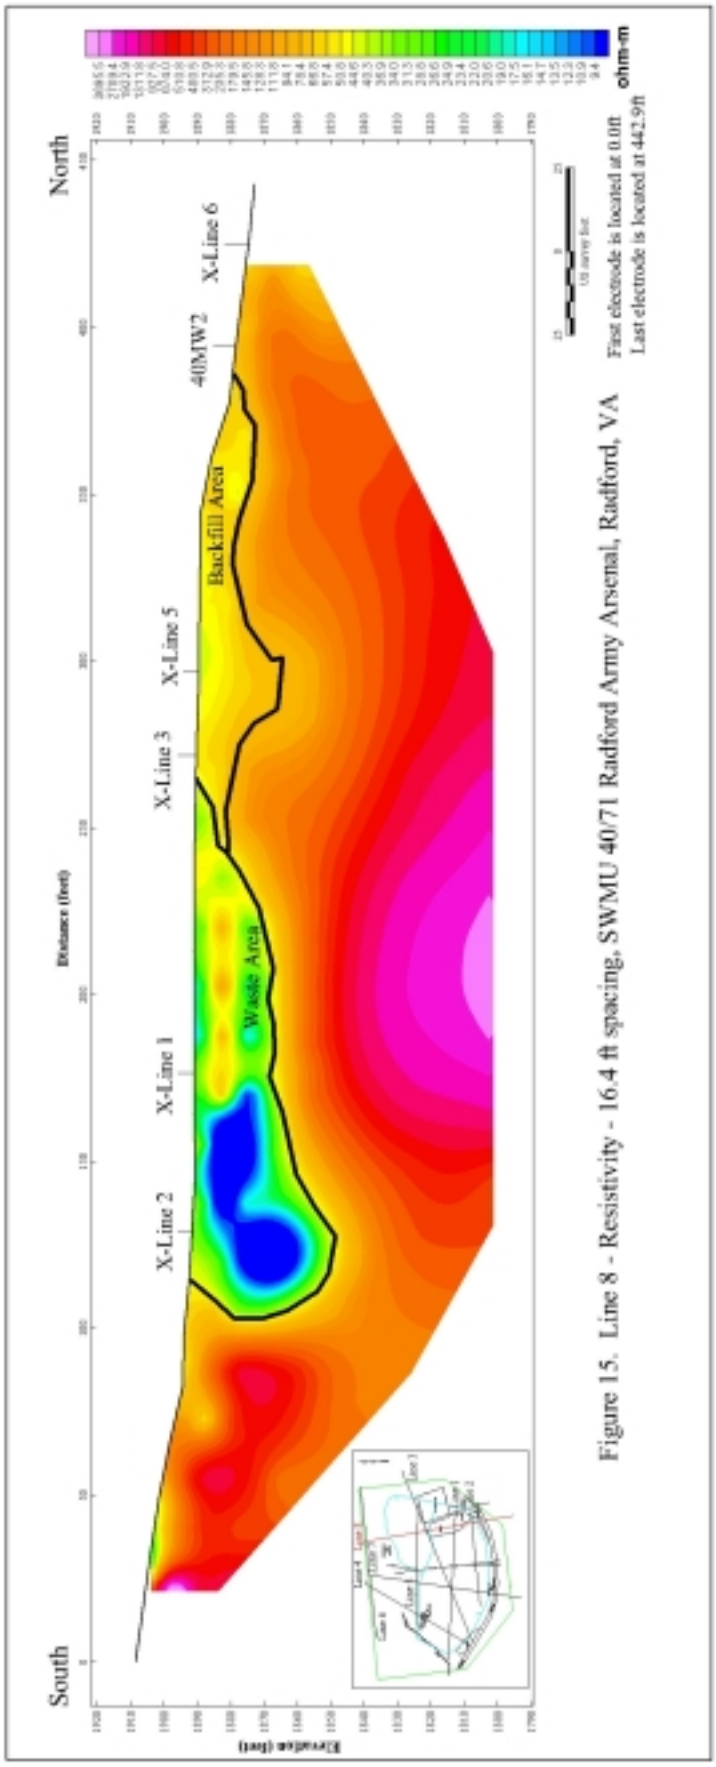

Figure 15. Line 8 - Resistivity - 16.4 ft spacing, SWMU 40/71 Radford Army Arsenal, Radford, VA

The bedrock surface is irregular and contains areas of lower resistivity. On Figure 14 near 40MW4, this lower resistivity correlates to the "soft" dolomite described during drilling. At that same location a bit deeper, the resistivity profile increases and may be correlated to the "hard" dolomite mapped in 40MW4. Line 6 (Appendix E) was run completely off the waste and backfill areas and displays a zone of lowered resistivity in the center of the profile approximately 40 feet below the surface. It was anticipated that karst might be present in this area. Typically, karst would appear as a very conductive anomaly if water/loose sediment filled or a very resistive anomaly if air filled. No profile from this area shows any anomaly that would undeniably indicate an air filled karst at depth. It may be that void formation is occurring at depth within those areas of lowered resistivity and is not distinguishable from the "soft" dolomite areas encountered during drilling (refer to Appendix E Line 1 near 150', Line 3 near 250', Line 4 near 275'& 300' (near surface), Line 5 near 135' (near surface), Line 6 near 50' / 200' / 260' & 370', Line 7 near 340' & 390' (near surface)).

In summary, Figure 16 is an interpretational map of the depth to the bottom of SWMU 40/71. Depths are listed in black next to the various resistivity profiles. Depths listed in parenthesis indicate that the bottom of the landfill was not imaged by the resistivity data and lies below that depth. A larger scale version of this map can be found in Appendix F.

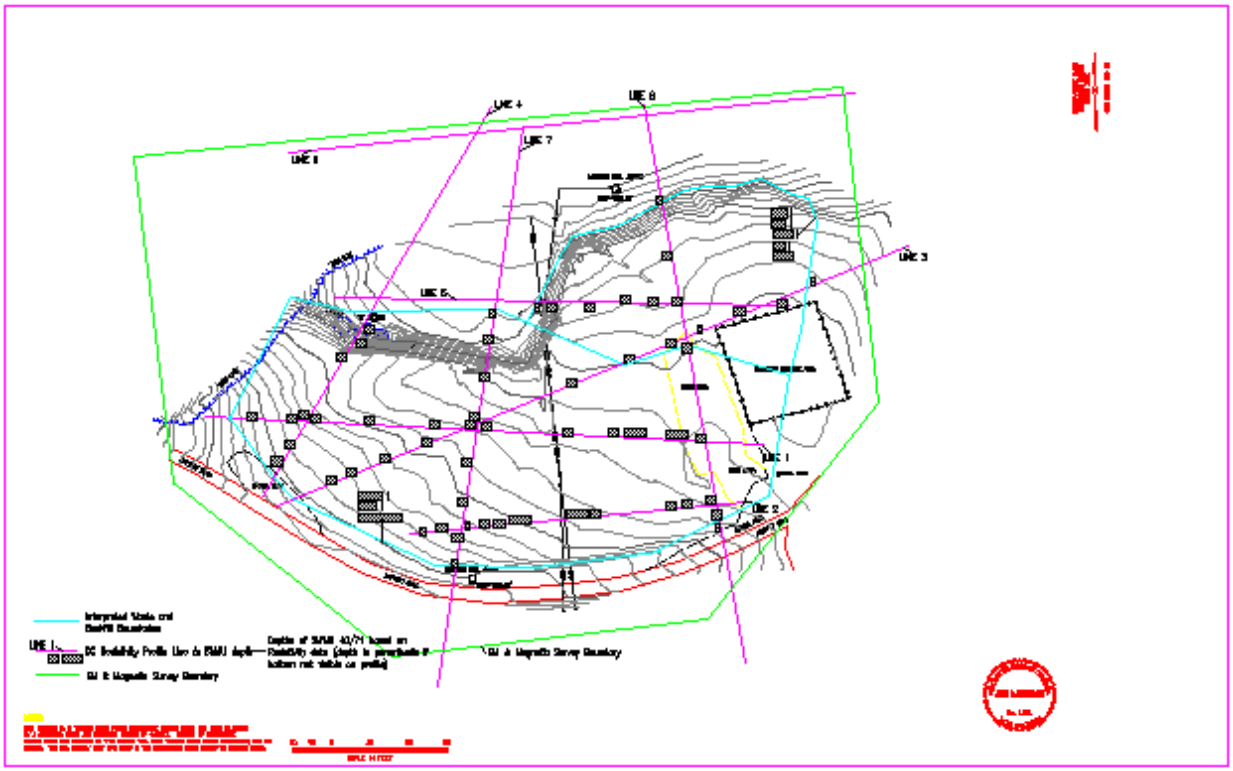

Figure 16. Interpretational map for SWMU 40/71 waste and backfill depths.

Appendix A
Electromagnetic Method

The electromagnetic (EM) induction method, which is founded upon Maxwell's Equations (the relationship between electric fields, magnetic fields and electric current), characterizes the electrical conductivity of the subsurface and can be used to characterize shallow geological conditions. Electrical conductivity is an inherent property of a material to conduct electrical current. Variations in shallow earth conductivity can result from changes in soil moisture content, groundwater constituents (contamination), and lithological properties, as well as buried man-made materials. The primary application of EM surveys in site assessments are for:

- Searching for waste pits and trenches,
- Determining boundaries of landfills and other burial sites,
- Delineating leachate plumes,
- Locating buried drums, USTs, and other isolated metallic objects, and
- Detecting buried unexploded ordnance (UXO).

The EM method involves exciting the ground material with a primary, time-varying, electromagnetic field of one or more frequencies, and recording perturbations of the normal field that result from secondary eddy currents induced in conducting bodies at or beneath the surface. The primary field is typically established, in practice, by passing an alternating current through a small coil (i.e., the transmitter coils). The intensity of the induced eddy currents in the subsurface is a function of the ground conductivity and is measured by the receiver coil. The receiver generally consists of one or more coils, suitably arranged and connected to a data logger. Field efficient EM instruments, such as the Geophex Electromagnetic (GEM) sensor (Figure A-1; Won et al., 1996), combine the transmitter, receiver, and processing electronics (data logger) into a single, lightweight, man-portable instrument.

Figure A-1. Photograph of the Geophex Electromagnetic (GEM-2) instrument during a site characterization study

The primary advantage of electromagnetic induction sensors for detection of shallow man-made targets is that these sensors are sensitive to either ferrous or nonferrous (e.g., aluminum, copper, iron, steel) metals. The electromagnetic induction sensor can be used in conjunction with magnetic surveys for enhanced detection.

Figure A-2, adapted from Won (1980), shows ranges of conductivity for typical earth materials and the relationship between transmitter frequency and the skin depth (i.e., the maximum depth of exploration). In general, sediments and sedimentary rocks have higher conductivity than igneous or metamorphic rocks. Clay, owing to its electrolytic interaction with water, exhibits high conductivity, while typical sand shows relatively low conductivity.

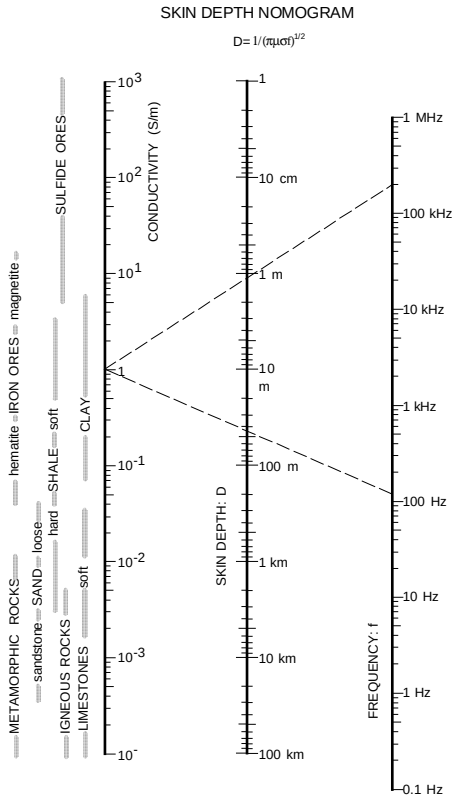

Figure A-2. Nomogram showing the relationship between transmitter frequency, ground conductivity, and depth of penetration. Magnetic permeability, μ, is assumed to be that of the free space. (From Won, 1980. Courtesy: Society of Exploration Geophysicists.)

The electromagnetic induction method can be used to target different depths of interest. The effective depth of exploration can be varied by changing either: 1) the spacing between transmitter and receiver coils, or 2) the frequency of the transmitted field (Patra and Mallick, 1980). The first method is known as *geometrical sounding* and involves recording data using several transmitter-receiver coil spacings at a fixed location; the depth of exploration increases with the coil spacing. The two coils systems (e.g., EM-24 by Geonics), although typically connected by an umbilical cord, are physically separate and thus require two field operators.

The second method is known as *frequency sounding* and involves changing the transmitter frequency, but keeping the transmitter-receiver coil constant (Figure A-3). The depth of exploration is inversely proportional to the square root of the frequency: a low frequency signal travels far through a conductive earth and, thus, sees deep structures, while a high frequency signal can travel only a short distance and, thus, sees only shallow structures. Therefore, broadband parametric sounding is analogous to depth sounding and can be used to create a pseudo 3-D subsurface image (Won, 1983).

Frequency sounding possesses inherent advantages over geometric sounding for depth imaging because: 1) signal attenuation does not allow a signal of fixed frequency to penetrate much deeper than several skin depths, and 2) geometrical sounding averages laterally and thus decreases the resolution. Theoretical and practical discussions on these methods may be found in Grant and West (1965), Keller and Frischkneckt (1966), Kaufman and Keller (1983), and Nabighian (1988).

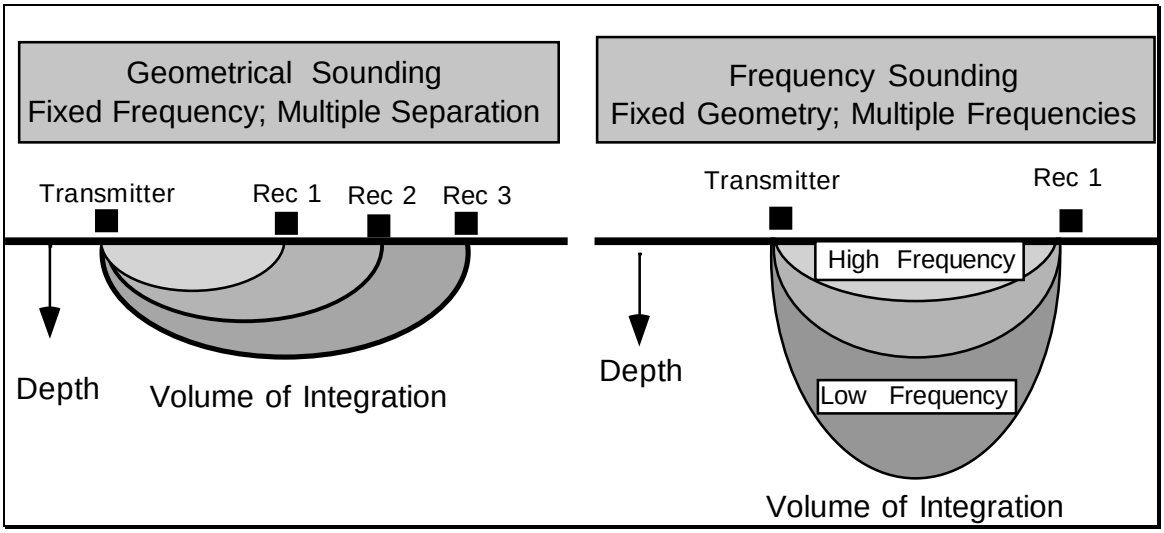

Figure A-3. Electromagnetic methods for depth sounding.

Appendix B
Magnetic Method

Magnetic methods provide a fast, efficient, and cost-effective technique to identify and characterize local high magnetic susceptibility targets that produce deviations in the Earth's magnetic field. Magnetic susceptibility is a basic material property and represents the degree of magnetization of a material placed in an external magnetic field. Magnetic susceptibility of a geologic material is proportional to its content of iron-bearing minerals, principally magnetite, the most abundant magnetic mineral in the Earth. The principal applications of magnetic surveys in site assessments are for:

- Locating buried drums, USTs, and pipes;
- Delineating pits and trenches containing ferrous materials;
- Delineating boundaries of landfills with ferromagnetic debris; and
- Mapping subsurface geology.

The signals measured in a magnetic survey are influenced by the ambient magnetic field of the Earth. The Earth's magnetic field resembles that of a single dipole whose axis deviates about 10 degrees from geographic north. The strength of the Earth's magnetic field is about 60,000 gammas near the north pole where it is directed vertically into the Earth, and about 30,000 gammas near the equator where it is parallel to the Earth's surface.

Buried steel objects cause local perturbations in the Earth's magnetic field (Figure B-1). The Earth's magnetic field magnetizes ferrous material (either man-made or natural) in parallel with and proportional to the local Earth's magnetic field. Therefore, the intensity and shape of perturbations caused by a buried drum, for example, is a function of latitude (Figure B-2). The total magnetic field measured is the vector sum of the ambient Earth's magnetic field and the local perturbation.

Two types of magnetic surveys are commonly conducted: 1) measurement of the total field, or 2) measurement of the vertical gradient. Although the field procedures are very similar for the two surveys, the measured data and interpretation methods can sometimes be quite different. The vertical gradient, measured by recording the magnetic field at two, vertically separated sensors and calculating the difference, is to detect and locate small and shallow-buried objects, such as drums. Because vertical gradient anomalies decay inversely proportional to distance from the object raised to the fourth power, as opposed to the third power for the total field anomaly, vertical gradient anomalies are more sharply defined in the immediate area of the ferrous object. In contrast, the total field anomaly of a small shallow ferrous object will be broad, and hence, possibly unidentified during an actual survey. Commercially available magnetic instruments (e.g., the G-858 Magnetometer from Geometrics) allow the simultaneous recording of the total field and the vertical gradient.

An example of a magnetic gradient survey, conducted to locate burial trenches that contain hazardous waste and miscellaneous debris, is shown in Figure B-3.

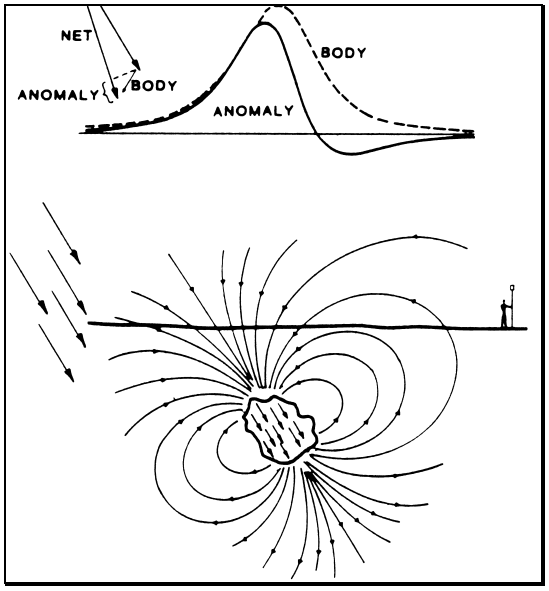

Figure B-1. The Earth's magnetic field induces a magnetic moment in buried ferromagnetic materials (bottom). This induced field, in turn, causes local perturbations (anomaly) in the measured total magnetic field (top).

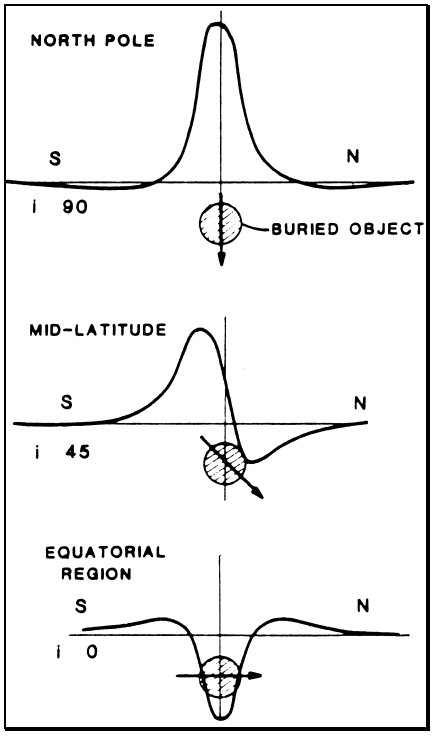

Figure B-2. Schematic illustration of the shape of magnetic anomalies (local perturbations) as a function of latitude.

Appendix C
Resistivity Method

The purpose of electrical surveys is to determine the subsurface resistivity distribution by making measurements on the ground surface. From these measurements, the true resistivity of the subsurface can be estimated. The ground resistivity is related to various geological parameters such as the mineral and fluid content, porosity and degree of water saturation in the rock. Electrical resistivity surveys have been used for many decades in hydrogeological, mining and geotechnical investigations. More recently, it has been used for environmental surveys. 2-D resistivity imaging surveys have been carried out for many purposes such as detecting leakage of pollutants from landfill sites, areas with undulating limestone bedrock, mapping of the over burden thickness , leakage of water from dams, and the saline water intrusion in coastal aquifer. The resistivity imaging method has also been used in underwater surveys in lakes and dams.

Resistivity values are measured by injecting a current into the ground via two electrodes and measuring the resulting voltage difference at two separate potential electrodes. From the current (I) and voltage (V) values, an apparent resistivity (p_a) value is calculated.

p_a = k V / I

The calculated resistivity value is not the true resistivity of the subsurface, but an ”apparent” value that is the resistivity of a homogeneous ground that will give the same resistance value for the same electrode arrangement. The relationship between the “apparent” resistivity and the “true” resistivity is a complex relationship. To determine the true subsurface resistivity, an inversion of the measured apparent resistivity values using a computer program must be carried out.

Resistivity surveys give a picture of the subsurface resistivity distribution. To convert the resistivity values into a geological picture, Table 1 shows the resistivity values of common rocks, soil materials and chemicals (Keller and Frischknect 1966, Daniels and Alberty 1966). Igneous and metamorphic rocks typically have high resistivity values. Sedimentary rocks, which usually are more porous and have a larger water content, normally have lower resistivity values. Wet soils and fresh ground water have even lower resistivity values. The resistivity of these rocks is greatly dependent on the degree of fracturing, and the percentage of fractures filled with ground water. Resistivity values have a much larger range compared to other physical quantities mapped by other geophysical methods. The resistivity of rocks and soils in a survey area can vary by several orders of magnitude.

Table 1. Resistivities of some common rocks, minerals and chemicals.

Material	Resistivity (Ω•m)	Conductivity (Siemen/m)
Igneous and Metamorphic Rocks		
Granite	$5x10^{3}$ - 10^{6}	10^{-6} - $2x10^{-4}$
Basalt	10^{3} - 10^{6}	10^{-6} - 10^{-3}
Slate	$6x10^{2}$ - $4x10^{7}$	$2.5x10^{-8}$ - $1.7x10^{-3}$
Marble	10^{2} - $2.5x10^{8}$	$4x10^{-9}$ - 10^{-2}
Quartzite	10^{2} - $2x10^{8}$	$5x10^{-9}$ - 10^{-2}
Sedimentary Rocks		
Sandstone	8 - $4x10^{3}$	$2.5x10^{-4}$ - 0.125
Shale	20 - $2x10^{3}$	$5x10^{-4}$ - 0.05
Limestone	50 - $4x10^{2}$	$2.5x10^{-3}$ - 0.02
Soils and waters		
Clay	1 - 100	0.01 - 1
Alluvium	10 - 800	$1.25 x10^{-3}$ - 0.1
Groundwater (fresh)	10 - 100	0.01 - 0.1
Sea water	0.2	5
Chemicals		
Iron	$9.074x10^{-8}$	$1.102x10^{7}$
0.01 M Potassium chloride	0.708	1.413
0.01 M Sodium chloride	0.843	1.185
0.01 M acetic acid	6.13	0.163
Xylene	$6.998x10^{16}$	$1.429x10^{-17}$

To acquire these data, a DC resistivity acquisition systems, such as the STING (Advanced Geoscienes, Inc.) must be connected to electrodes that are inserted into the ground. To reduce surface resistances, electrodes are treated with salt water prior to data acquisition on each profile.

These systems required approximately one hour to record resistivity values across an entire 28-electrode array. Data are transferred from the resistivity meter to a laptop PC and immediately inverted to produce 2D resistivity cross-sections.

Geophysical Surveys: SWMU 40/71, Radford Army Ammunition Plant, VA.

1. INTRODUCTION

SWMU 40/71 is located southwest of the Main Manufacturing Area of the Radford Army Ammunition Plant (RFAAP) (Figure 1). SWMU 40/71 was reportedly used as a sanitary landfill in the 1970s and early 1980s for the disposal of uncontaminated paper, municipal refuse, cement, and rubber tires, and is covered with a soil cap and grass. It is not known whether hazardous wastes or wastes containing hazardous constituents were disposed of in the landfill. During 1991-1992, a fenced enclosure for asbestos storage was constructed over the northeast corner of the SWMU. SWMU 40/71 also contains an area used between 1962 and 1982 to flash-burn metal process pipes contaminated with chemical propellants. Previous geophysical investigations by Geophex (2001) revealed the likelihood of a complex bedrock topography and geo-electric character.

This report covers surface geophysical surveys using two-dimensional resistivity profiling and seismic refraction tomography performed at SWMU 40/71 during the time period of August through September 2002 by Argonne National Laboratory (ANL). Additional borehole velocity measurements were collected in 2 monitoring wells adjacent to SWMU 40/71 to help guide the seismic interpretations, and downhole electrical and natural-gamma logging surveying was collected by USACE staff to help constrain the resistivity models.

2. OBJECTIVE

The primary objectives for SWMU 40/71 were to provide verification of the existing geophysical models, assess the top-of-bedrock beneath the site, and assist in further defining both the lateral and vertical extent of the former disposal activities. Information obtained by the geophysical surveys will be used in developing plans for any follow-on focused studies relative to for potential constituents in soil.

3. TECHNICAL APPROACH

Site conditions and remediation goals are critical in determining what geophysical techniques are appropriate for an investigation. RFAAP is underlain by carbonate rock (limestone and dolomite) that in places is structurally complex (folded and faulted) and contains clastic interbeds and tectonic breccias. Overburden sediments range from 0 to 60+ feet in thickness, and in landfill areas, the overburden may contain a considerable thickness (>10-ft) of debris associated with waste disposal activities.

Geophysical investigations provide subsurface geologic information using non-intrusive techniques, the data from which are often times interpreted in more than one way. Therefore, the use of two or more geophysical methods, plus the integration of available geotechnical information, allows for a more constrained interpretation of the geophysical data.

Two-dimensional electrical resistivity imaging (2D-ERI) and seismic refraction profiling/tomography are applicable techniques that can map changes in the electrical (2D-ERI) and acoustic (seismic) characteristics of the underlying soil and rock. These

techniques provide complementary information about the subsurface, which can provide a more definitive interpretation of subsurface anomalies over that obtained using the techniques individually. A more detailed description of the theory and operation of these methods are given in the Geophysical Methods section.

In general, the underlying rock should have a higher seismic-velocity than the overburden sediments, and should be readily distinguishable on the resulting tomographic sections. A decrease in seismic velocity will occur where the rock is fractured (weak zones), less competent, or dominated by solution cavity development.

The electrical response of the rock is more complex and depends on the type of strata present and the electrical properties of the pore fluid. Higher electrical-resistivity should occur if carbonate rock is present. Alternatively, the presence of an electrically conductive pore-fluid, or a significant clay fraction, could yield lower-resistivities than expected. Air-filled fractures and voids would likely increase the electrical resistivity.

The initial Geophex surveys used a Virginia licensed land surveyor to establish a local grid system at SWMU 40/71. Profile locations for this investigation were based on measuring off known points from the existing survey, and on using a differential GPS to locate the end points of the individual profile lines. Positional information was converted to the US State Plane, NAD-83, US Survey Feet datum, and were crossed checked by overlaying onto the existing GIS base map.

4. Geophysical Methods

Geophysical methods used in this investigation consist of two-dimensional electrical resistivity imaging (2D-ERI), seismic refraction profiling (tomographic and earth-layer solutions), and vertical seismic profiling (check shots). The Radford specific standard operating procedure for geophysical surveys (SOP 20.7) only covered EM surveys, and provided guidelines for both vertical and horizontal electrical resistivity profiling (not the full two-dimensional surveys used for this investigation). In order to meet data quality and project objectives, the following guidelines developed through ASTM were used in the construction and implementation of the geophysical surveys; ASTM-D6431-99 for 2D-ERI profiling, and ASTM-D5777-00 for the seismic-refraction surveys. Vertical seismic profiling was conducted following specific sections of ASTM-D65777-00 and ASTM-D4428M-00 (cross-hole surveys) that deal with the emplacement of receivers within a borehole, the selection of appropriate energy sources, and the parameters for recording the seismic signal. Appropriate sections of the USACE (1995) manual describing geophysical investigations was also used for the design and implementation of geophysical surveys used in this study.

2D Electrical Resistivity Imaging

Two-dimensional electrical resistivity imaging (2D-ERI) measures horizontal and vertical variations in the electrical-resistance of the subsurface. For the Radford Army Ammunition Plant, the underlying carbonate rock was expected to be of higher-electrical resistivity than the overburden sediment, though the presence of conductive fluids or significant clay fraction would tend to decrease the resistivity. In addition, weak or fractured zones within the carbonate rock should display changes in electrical character,

from either an increase in resistivity for air-filled regions, to a decrease in resistivity for clayey intervals. The trench work within the overburden sediment is expected to produce a zone of lower electrical resistivity. In addition, the presence of waste material and degradation products may also lower the electrical response in the vicinity of the trench.

The Advanced Geosciences, Inc. (AGI) Sting/Swift™ system is an automatic multi-electrode system and earth resistivity meter that acquires data by passing an electric current between two electrodes and measuring the potential difference (voltage) between them. The measured voltage is a factor of the resistance of the earth material and the geometry of the electrode array (e.g. dipole-dipole, Schlumberger). Resistivity, an intrinsic property of the earth, is then calculated using the measured voltage, the amperage, and a geometric factor for the electrode array. The calculated resistivity value is actually an "apparent-resistivity" because it includes the resistances of all the material that the electrical current passes through. A modeling procedure is then used to convert the measured apparent-resistivity data into earth-layer resistivity sections.

The electrodes used to measure the voltage difference are arranged in various geometries called arrays, and the calculated apparent-resistivity value is interpreted to represent a depth point at the center of an individual array. Depth of measurement is related to width of electrode separation, with greater electrode separation resulting in greater depths of penetration. Classically, two different techniques are used to determine the electrical resistivity of earth materials. In vertical electrical sounding (VES), electrodes are expanded about the center of an array to generate a layered electrical section at a single point (vertical profile). The lateral profiling technique uses an array with a fixed electrode separation, which is marched along a line to image lateral variations at a constant depth.

Two-dimensional electrical-resistivity imaging (2D-ERI) combines VES and lateral profiling into a single survey without the time-consuming process of constantly moving electrodes and reconnecting cables. In 2D-ERI a single cable connects a linear array of electrodes, which are turned on and off using a preprogrammed sequence via a controller box. The raw apparent-resistivity data are typically displayed as a pseudosection where the lateral position of the measurement point is placed at the center of the corresponding electrode array, and the depth of the measurement increases with increasing electrode spacing. Apparent-resistivity pseudosections are useful for performing quality-control checks and for examining whether manmade objects (e.g. buried utilities?) have impacted the data set.

Apparent-resistivity pseudosections are converted, through a process termed inversion, into an electrical-resistivity cross-section showing true earth-layer resistivities. RES2DINV (Loke, 1996), a commercially available program, was used to perform the two-dimensional inversion modeling. During the inversion, the subsurface is divided into a number of blocks equal to or less than the number of measurement points. A smoothness-constrained, least-squares inversion routine is used to estimate the resistivity value of each block, and finite-element or finite-difference forward modeling is used to calculate the resulting pseudosection. The model is iteratively corrected until an apparent-resistivity pseudosection calculated from the model converges with the measured apparent-resistivity pseudosection. A root-mean-square (RMS) error calculation of the difference between the two apparent-resistivity pseudosections is used

as a measure of the degree of fit for the model. Maximum convergence often occurs within 3 to 5 iterations, after which RMS values do not change significantly and the model may start to become unstable.

Seismic Refraction Tomography

Seismic refraction provides acoustic velocity and layer depth information (Redpath, 1973). The refraction method generally depends on an increase in seismic-wave velocity (speed of sound through earth material) with depth, though the newer tomographic codes presently available have the capability of handling a velocity inversion (zones of lower seismic velocity underlying zones of higher velocity). Both a tomographic model and an earth-layer (refractor) cross-section were implemented as processing outputs from the refraction profiling. The commercially available SeisOpt2D (Optim, 2001) code was used to construct the tomographic model, and the SIPT2 (RimRock, 1992) software package was used to generate the earth-layer cross-section.

In the refraction method, the seismic energy (or wave) bends (refracts) at interfaces between layers of different velocities. In the special case where the seismic wave has been refracted parallel to the interface, the seismic energy travels along this interface, generating a head wave that returns to the surface. A linear array of acoustic receivers (geophones) was used to record the travel-time of the first returning seismic signal. This information was plotted on a time-distance graph; for the case of plane layer geometry, the time-distance plot will show distinct linear segments for each layer where the inverse of the slope of a segment is equivalent to the apparent seismic velocity for a particular layer.

A multi-channel, engineering seismograph was used to record the seismic refraction information, and either a 500-lb weight drop elastic wave generator (EWG) or a 16-lb. sledgehammer were used as the energy source. Geophones (acoustic-receivers) were spaced at a 3ft interval during surveying. Shot points were acquired at every fifth geophone position, which allows input to the tomographic modeling software.

The processing sequence for the refraction data consisted of:

- Picking first arrival times of return energy for each shot;
- Assigning the array-geometry to the first arrival data;
- Inverting the first-arrival information for velocity and depth using the SIPT algorithm (delay-time method); and
- Constructing a tomographic model of the first-arrival information using the SeisOpt2D code available from Optim Software.

The SIPT method took advantage of the reverse-spread geometry and far offset shot points of the survey to compute depths to interfaces below each geophone. The algorithm employed the delay-time method of Pakiser and Black (1957) to calculate depth and position of refraction horizons. The generated refraction model was further refined using a ray-tracing algorithm which overcomes difficulties associated with dipping or undulating horizons.

The SeisOpt2D software achieved a globally optimized, velocity model using only first arrival travel time data and array geometry as input. SeisOpt2D required no prior assumptions of subsurface structure, or any other subjective data, as input. A controlled Monte-Carlo inversion method was employed where the derived models were conditionally accepted or rejected based on a probability criterion. The criterion allowed the algorithm to escape from non-unique, local, travel time minima to achieve a unique, globally optimized model of subsurface velocity structure. The algorithm made no assumptions on the orientation of the subsurface velocity gradient, and could therefore reveal vertical structures and strong lateral gradients, if present.

Borehole Velocity Survey

Borehole velocity surveys (check shots) were used to measure the in-situ velocity of the sediment and rock penetrated by adjacent and/or nearby wells. These data provided confirmatory velocity information for the refraction models. The general configuration for recording the downhole seismic data consisted of a three-component geophone, implementing 40Hz receiver elements. The downhole geophone was moved in 5-ft increments within the borehole (5-ft receiver spacing). A sledgehammer was used as the energy source, and is placed at offsets up to 15-ft from the borehole. Three additional geophones were placed on the surface at offsets up to 20-ft from the borehole, and are required to resolve any shot-timing variations that occur when using impact sources.

The velocity of the earth material and the type of well construction used governs the placement of the sledgehammer source, vertical spacing of the downhole receiver, and the sampling rate. The objective was to record a seismic signal that has been transmitted through the earth, and not along the borehole wall or borehole casing. This required offsetting the shot point from 5 to 15 ft from the borehole so that the velocity of the near surface material (upper 30 ft) could be measured.

The vertical spacing used was primarily dependent on expected velocities within the subsurface, and the recording limitations afforded by the seismic gear. Data recorded at the 0.1 ms interval (10,000 samples per second) used for RFAAP allowed discerning arrival time changes as small as 0.2 ms (twice the sampling interval). Given an expected velocity range of 10,000 to 25,000 ft/s, the 5 ft spacing used yielded theoretical arrival time changes from 0.2 to 0.5 ms.

Data processing consisted of the following:

- Picked first arrival energy for the downhole and reference geophones;
- Sorted the arrival-time data by depth point;
- Computed and apply shot-timing corrections using the arrival time picks obtained from the reference geophones;
- Computed the average velocity to a receiver station using the straight-line distance from the shot to the receiver and the corrected arrival time;
- Converted to vertical travel-time using the depth point for the receiver and the computed average velocities; and

- Computed interval velocities using least squares line-fitting algorithm to estimate the slope (inverse of velocity) between measurement points. The least-squares operator has the advantage of smoothing over small time-picking errors.
- Where available, the data were correlated with the lithologic information and other available borehole geophysical data.

5. Geophysical Surveys

Geophysical surveys were conducted along 4 profiles at SWMU 40/71 (see Figure 1). Both seismic and resistivity data were collected along Profile ANL L-2, which connects wells 40MW2 and 40MW4 and uses the well log information as a basis for interpreting the geophysical data collected at SWMU 40/71. Seismic data was also collected along profile ANL L-1, which is tied to well 40MW2 and can be used as a tie line for Geophex profiles L-1 and L-8. 2D-ERI data were collected for profiles Geophex L-1 and Geophex L-8, in order to confirm the geophysical models constructed by Geophex (2001). Interpretation of the resistivity models for these latter two profiles was based on results for lines ANL L-1 and L-2.

Borehole Velocity Surveys

Borehole velocity surveys were conducted in well 40MW2 to a depth of approximately 57 ft, and in 40MW4 to about 64 ft with the results shown in Figures 2 and 3. Highly weathered rock was encountered in both wells, with 40MW2 underlain by "softer zones" at depth. The corresponding velocity log for 40MW2 shows an increase in velocity from 1900ft/s (580m/s) to 5000ft/s (1500 m/s) at a depth of approximately 25 ft, with a thinner zone of higher velocity at 5-to-15ft also present. At depth (below 45 ft), the velocity log indicates a relatively low-velocity material (<2000 ft/s), which most likely corresponds with the "very soft, very weathered" silt and clay zones encountered. Well 40MW2 is most likely penetrating weathered bedrock.

The velocity log for 40MW4 shows an increase in velocity from 2500 ft/s (770 m/s) to greater than 10,000 ft/s (>3300 m/s) at a depth of approximately 25 ft. This likely represents a change from overburden/weathered rock to more competent rock. Velocities of 10,000 ft/s generally correlate with limestone of soft to intermediate hardness (Press, 1966). An interval of lower velocity is indicated at 45 ft in depth, which corresponds to a zone where coring was stopped due to excessive water loss, and where cuttings did not return to the surface.

Profile ANL L-2

Profile ANL L-2 is oriented roughly southwest-to-northeast, and connects with wells 40MW2 and 40MW4 (Figure 1). Both dipole-dipole and Schlumberger array data were collected for the 2D-ERI profile, and the seismic survey used a 3-ft geophone spacing and a 16 ft shot points interval. Borehole velocity logs were collected in Wells 40MW2 and 40MW4; downhole electrical induction and natural gamma surveys of these wells were performed by USACE staff. The resulting geophysical models constructed for Profile ANL L-2 are shown in Figure 4, with the seismic model in the upper panel and the resistivity models in the bottom two panels. Shown are intersections with profiles

Geophex profiles Line-1, Line-2, Line-5, the positions of wells 40MW2 and 40MW4, and the results from the borehole geophysical surveys.

The seismic tomography model is shown in the top panel of Figure 4 with magenta colors representing zones of lower velocity and green to red colors, higher velocity. The borehole velocity surveys are scaled and shown as brown trace lines at the positions of the well. Two contour values, 4920 ft/s (1500 m/s) and 2625 ft/s (800m/s) are highlighted as heavy black and gray lines, and used to provide a reference point for comparison between the seismic and resistivity models. The gray highlighted contour line is interpreted to represent the top of the weathered rock, and the black highlighted contour line, the top of competent rock.

The borehole velocity and drilling logs were used to corroborate this interpretation. At well 40MW4, the interpreted top-of-rock is present at the approximate depth where the increase in velocity occurs on the velocity log. Below this depth, the seismic model predicts velocities of >7700 ft/s (2250m/s) whereas the velocity log shows a range from 5500 to 12000 ft/s. The gray contour line (2625 ft/s) crosses well 40MW2 where top-of-weathered rock can be inferred from the borehole velocity log and driller's report. Here, borehole velocities of approximately 5000 ft/s were measured in the 25 to 50 ft depth interval. The tomographic model indicates a range in velocity from 3400 to 6300 ft/s within this interval.

Based on this interpretation, a maximum depth of approximately 40ft to top-of-competent rock is predicted near profile coordinate 150X. The bedrock surface rises towards ground level to the south, and likely reaches the ground surface south of 40MW4 where outcrop was observed during the field survey. An elevation of approximately 1870 ft (AMSL) is predicted at 40MW4.

North of 150X, the bedrock surface is relatively horizontal, showing an increase in the thickness of the weathering horizon. Near 40MW2, the surface of the competent bedrock appears to decrease rapidly in elevation, as shown by the lower velocity (and softer) material observed in the well at depth.

The 2D-ERI models (bottom two panels of Figure 4) map zones of higher resistivity (> 500 ohm-m) on both the north and south ends of the profile at depths consistent with where the borehole and seismic data place the top-of-rock. These higher resistivity zones are interpreted as representing rock, and this interpretation is extended in to the middle part of the profile. South of well 40MW4, the resistivity models predict bedrock to be close to or at the ground surface, which is corroborated by visual observation of bedrock outcrops in this vicinity.

Towards the north, the position of the bedrock surface predicted by the resistivity models is in fair agreement with that by seismic data. At well 40MW2, both resistivity models indicated higher resistivities at the same depth that increased resistivities were measured by the downhole logging. A decrease in the gamma response also occurs here, indicating a decrease in the amount of clay material present.

The position of the zone of lower resistivity in the central part of the profile is the major discrepancy between the geophysical models. The dipole-dipole resistivity-model (middle panel, Figure 4) indicates low resistivity (<20 ohm-m) to depths of 70-to-80 ft

below ground surface between coordinates 50X and 125X. However, at this location both the seismic and Schlumberger resistivity data predict a bedrock depth of 20-30 ft. The Schlumberger model maps a zone of intermediate resistivity (<100 ohm-m) between coordinates 150X and 225X that could be interpreted to represent a zone of "weak" rock. Here, the dipole-dipole solution indicates high resistivity (>500 ohm-m), and both resistivity models indicate a horizon equivalent with where the seismic model places top-of-rock.

Discrepancies such as the above are commonly observed between resistivity models of different vintages, array types, and sensitivity to subsurface conditions. This requires viewing anomalous zones on the resistivity sections with caution, and only fully accepting the size and breadth of such features where other data support such an interpretation. For example, the low-resistivity zone mapped by the dipole-dipole model at 50-125X is most likely over-extrapolated both vertically and laterally. Taken by itself, the dipole-dipole model could be interpreted to indicate a thick pile of waste. However, the seismic bedrock surface cuts through this low and forces the interpretation to presume that clay zones, or other sources of low-resistivity, are present within the rock. E.g., a large amount of conductive waste (high metal content) could bias the resistivity data in this area to represent a broad zone of low-resistivity.

Profile Geophex L-1

Profile Geophex L-1 was reoccupied by ANL during September 2002 using the same acquisition and array setup used in the original Geophex survey. A dipole-dipole electrode array and 16 ft electrode spacing was used to collect the 2D-ERI data. The profile is oriented approximately west-to-east, and crosses an anomalous area on the electromagnetic and magnetic maps interpreted to be associated with past disposal activities (Geophex, 2001). Stakes marking the endpoints of the original profile were not found during resurvey. Thus, the resurvey used endpoints measured off the supplied CAD drawing, which are estimated to be within 3-to-6 feet of the original Geophex location.

The original published resistivity model for L-1 is shown in Figure 5 (Geophex, 2001, Figure E-1). A broad and thick zone of low-resistivity is modeled in the eastern third of the model, which was originally interpreted to represent a thicker accumulation of waste material. Note the similarity of this low-resistivity zone to that observed on dipole-dipole resistivity model for Profile ANL L-2 (Figure 4, middle panel), which places some doubt on interpreting the resistivity models in this manner at this site.

Prior to the field effort, it was noticed that the topography indicated on the Geophex figure appeared to be incorrect based on the available topographic map. This error was later confirmed during the field surveys where the approximate 10-12 ft drop in topography near profile 360X was in actuality a relatively flat, slightly sloping area. It proved necessary to reprocess the original Geophex data using the correct topographic data in order to compare with the ANL resurvey. This reprocessing has the advantage of using the same processing steps for both sets of data, and to contour and display using the exact same color scale and gridding algorithm. Geophex Line 8 (described later) was also reprocessed for the direct comparison with ANL data in the next section.

The model results for the reprocessed Geophex Line 1, and the ANL reoccupation of this profile, are shown in Figure 6. Also shown are the intersections with profiles ANL L-2, Geophex L-8, and ANL L-1 with the interpreted top-of-rock indicated as short horizontal tick marks. A bedrock surface is drawn as a gray-dashed line connecting these tick marks. The reprocessed Geophex Line 1 (top panel, Figure 6) still shows the same general character with a thick zone of low-resistivity in the eastern third of the model, and a decrease in depth below ground surface to the west. The bedrock surface predicted by the cross-line data cuts through the zone of low-resistivity.

The ANL resurvey is shown in the lower panel of Figure 6, and models the bedrock surface as a high-resistivity zone (>400 ohm-m) with a relatively horizontal top at approximately 1860 ft in elevation. There is a slight dip to the west of approximately 15ft over the length of the profile. The top of this high-resistivity zone is in fair agreement with where the intersecting profiles interpreted the top-of-rock.

The discrepancies between the original and resurveyed profile are most likely due to seasonal changes in subsurface moisture content, and on the emplacement quality of the electrodes. For example, the zone of moderate resistivity on the eastern end of the original profile is modeled as a zone of much higher resistivity in the ANL data (likely caused by drier surface conditions during the ANL survey).

Profiles ANL L-1 and Geophex L-8

Both profiles were collected along roughly south-to-north transects, and cross the interpreted eastern end of the waste disposal end. Profile ANL L-1 was collected sub-parallel to Geophex L-8 in order to tie to well 40MW2. Interpretation of the seismic data collected for ANL L-1 is used to guide re-interpretations of Geophex L-8. Thus, the seismic model for ANL L-1, and the resistivity models for Geophex L-8 are shown together in Figure 7.

Profile ANL L-1 was collected using a geophone spacing of 3 ft and two spreads of 48 geophones, and crossed through the eastern end of the identified waste disposal area where the previous resistivity surveys indicated a thicker zone of waste. The seismic model (top panel, Figure 7) images the bedrock surface as a northward sloping horizon, with an increase in depth below ground surface to the north. As for the ANL L-2 interpretation, two highlighted contour lines (gray at 2625 ft/s, and black at 4921 ft/s) are used to indicate the interpreted top of weathered rock and top of bedrock. To the south, the interpreted bedrock surface likely intersects the ground surface where outcrop was observed. Depth to bedrock averages approximately 30 ft below ground surface in the central part of the profile.

The ANL L-1 seismic model predicts a higher bedrock surface at well 40MW2 (1850 ft versus 1840 ft). This discrepancy is probably due to an edge effect in the ANL L-2 model, as geophone coverage for ANL L-2 ends at 40MW2 (geophone coverage on ANL L-1 extends past Well 40MW2).

The original survey along profile Geophex L-8 used a dipole-dipole array geometry and electrodes spaced at 16 ft intervals. Profile endpoints were located during the resurvey using the supplied base map, are probably within 3-to-6 ft of the original profile location. The ANL resurvey used the same electrode spacing and collected both dipole-dipole and

Schlumberger array geometries in order to judge the relative sensitivity of each array type to site conditions.

The reprocessed model constructed from the original Geophex data is shown as the second panel in Figure 7. Also shown are positions of the access road, well 40MW2, and the intersection with Geophex profiles L-1 and L-8. A fair agreement between the resistivity and seismic interpreted bedrock surface is observed in the northern two-thirds of the model section. In this case, the bedrock is modeled as a zone of higher resistivity (>250 ohm-m). High-resistivities (>500 ohm-m) are modeled on the southern end of the profile, and are interpreted to correlate with bedrock that outcrops in this vicinity. A zone of low-resistivity (<20 ohm-m) is modeled between 100-150X, suggesting that the waste reaches upwards of 40 ft in depth at this point. The corresponding seismic depth to rock, however, cuts through this low-resistivity zone.

The third and bottom panels in Figure 7 are the resistivity models constructed from the ANL resurvey. The ANL dipole-dipole model (third panel) suggests that the original low-resistivity zone (<20 ohm-m) is much narrower, and is likely affected by the presence of the road. Within the 100X-to-150X coordinate range, the bedrock surface modeled by the dipole-dipole resurvey agrees closely with where the seismic model (ANL L-1) places bedrock.

The Schlumberger model (bottom panel) has smeared out the near surface low-resistivity zone, creating a broader and deeper feature than is likely present. To the north, both of the resurveyed and original resistivity models are in rough agreement for depth to rock. Note that the thick weathered zone in well 40MW2 is modeled with intermediate to high resistivities (>100 ohm-m).

6. Summary

Geophysical surveys conducted at SWMU 40/71 were able to refine the interpretation of the probable vertical component of waste. The resurvey included two of the original 2D-ERI profiles, and the acquisition of two additional geophysical profiles (a combined 2D-ERI/seismic, and one seismic only). These latter two profiles were tied to existing wells, which allowed for a more accurate correlation with the local geology.

Previous investigations relied primarily on the interpretation of 2D-ERI data, and argued for a relatively thick accumulation of waste material (in excess of 60 ft). These interpretations were based on the presence of broad zones of low-resistivity (<20 ohm-m) thought to be due to the presence of waste. After a review of the resurveyed and new profiles, it is highly probable that clayey zones within the rock, and not waste material, are the source for these low-resistivity features.

Interpretations based solely on the 2D-ERI low-resistivity zones must remain highly tentative unless corroborating information (either borehole or other geophysical methods) support the presence of a topographic bedrock depression. This is due primarily to the ambiguity in interpretation presented by 2D-ERI models.

A test profile, ANL L-2, used a combined seismic and 2D-ERI survey to map the bedrock surface between wells 40MW4 and 40MW2. A zone of low-resistivity imaged by the dipole-dipole model for this line was in stark disagreement with the seismically predicted bedrock surface. The best possible interpretation at this time is that the low-resistivity zone is either an over-extrapolated modeling artifact, and/or represents clayey or low-resistivity zones within the bedrock. The low-resistivity zone cannot be argued as a feature related to buried waste, as this would require a significant excavation and shoring of the underlying bedrock at this locality.

The resurvey of profile Geophex L-1 did not produce the broad zone of low-resistivity on the eastern end of the profile. This is likely due to differences in electrode-ground contact, and on changes in subsurface moisture conditions. The resurvey model appears to be in closer agreement to where the cross-line models predict top-of-rock.

Interpretation of profile Geophex L-8, which includes the sub-parallel ANL L-1, suggests a shallower depth to rock than predicted by the low-resistivity zone on the original profile. The resurveyed 2D-ERI model indicates that this zone is narrower in width, and possibly associated with electrode emplacement problems in the coarse-grained fill material near the access road. The new model indicates a zone of very low-resistivity immediately above the modeled bedrock surface (both 2D-ERI and seismic), which correlates with where the apparent conductivity survey (Geophex, 2001) maps an electrically conductive zone.

Integration of seismic refraction, 2D-ERI and downhole geophysical logging, with the inclusion of existing geotechnical data, has provided an improved understanding of the subsurface conditions under SWMU 40/71. A greater weight can be given to the interpretation in areas where the different geophysical models agree, which is further enhanced by constraining the interpretation based on borehole lithologic and geophysical logging. Co-interpretation of seismic and resistivity methods generated a better perception of the likely vertical thickness of waste, than did the sole analysis of 2D-ERI

data used by previous efforts. In this case, the bedrock surface mapped by the seismic data was in some areas masked by the presence of electrically conductive material on the 2D-ERI profiles. The ability to measure two different physical properties (electrical and acoustic) provides a greater chance to overcome these "masking" effects.

The Radford specific standard operating procedure for geophysical surveys (SOP 20.7) needs revision to include two-dimensional electrical-resistivity imaging (2D-ERI) and seismic refraction profiling. RFAAP SOP 20.7 does cover vertical electrical sounding (1D modeling) and horizontal electrical-resistivity profiling, however, these techniques are currently used less frequently than the more powerful 2D-ERI method. In light of this deficiency in SOP 20.7, we suggest updating the resistivity section two include 2D-ERI methodologies, and adding a section that covers seismic refraction and vertical seismic profiling. These new sections should incorporate relevant information found in the ASTM documents, the USACE (1995), and take advantage of lessons learned from the previous geophysical surveys (Geophex, 2001; ANL 2003).

1.0 INTRODUCTION

1.1 SITE DESCRIPTION

Solid Waste Management Unit 40 (SWMU 40) is an inactive landfill (also known as the Nitro landfill) located in south-central portion of the Main Manufacturing Area (MMA) at Radford Army Ammunition Plant (RFAAP), Radford, Virginia (Figure 1). The landfill was not permitted and received paper, office trash, concrete, and rubber tires during the 1970s and early 1980s. Operations ceased and the unit was closed with a clay cap and grass cover. In approximately 1991, an asbestos container storage area was constructed immediately northeast of the landfill area. This area is fenced enclosed gravel covered area that contains a covered roll off container box used to temporary store asbestos containing material in double bags. Figure 2 shows the site layout.

The site is located at an elevation of approximately 1,880 to 1,900 feet (ft) above mean sea level in an upland area characterized by gently to steeply sloping ridges, the presence of landforms indicative of karst topography (e.g., sinkholes) and a general downward slope toward the northwest. The site is topographically lower than areas to the east, south, and west, and topographically higher than areas to the north (Figure 1).

Dense maintained grass covers the site. The land slopes gently to the northeast. The southeastern portion of the area is 4 to 5 ft below the grade of a generally east-west bearing paved road, whereas the southwestern portion of the site is generally level adjacent to this road. The western portion of the site is roughly coincident with a tree line. The northern boundary of the site is characterized by a distinct 10-ft scarp running generally east west and the eastern boundary is roughly coincident with the fenced asbestos storage area and is further defined by a paved road. SWMU 71, the Flash Burn Area, is located on the southwestern corner is identified by a small area surfaced with gravel.

1.2 SITE BACKGROUND AND PREVIOUS INVESTIGATIONS

The Resource Conservation and Recovery Act (RCRA) Facility Assessment (RFA) conducted by the U.S. Environmental Protection Agency (USEPA) in 1987 identified the site as having the potential to release contaminants into the environment (USEPA, 1987).

In 1992, the Environmental Photographic Interpretation Center (EPIC) under the direction of USEPA performed an assessment of multiple SWMUs at RFAAP using selected aerial photographs taken from 1937 to 1986. The study identified features representing a potential groundwater or surface water contamination sources (USEPA, 1992). Activity was first noted at SWMU 40 in a 1971 photograph and was reportedly ongoing through a 1986 photograph. The 1971 photograph reportedly indicated significant filling with three phases interpreted in the site area (USEPA 1992). The 1986 photograph indicated most of the site was re-vegetated with the exception of the northeast corner where recent filling was visible. SWMU 71 activity was first noted in the 1986 photograph. A photo-geologic interpretation was also performed as part of the EPIC study to identify solution features such as fractures and sinkholes south of the south central MMA.

Dames & Moore conducted a Verification Investigation (VI) at the site in 1991 and 1992. Four borings were completed around SWMU 40 to a depth of 49 to 162 ft below ground surface (bgs) for planned monitoring well installations. Groundwater was not encountered during drilling or in the subsequent measurements collected from borings 40MW2 and 40MW4. Bedrock encountered in the borings consisted of argillaceous limestone and dolomite with abundant clay zones. Numerous zones of intense weathering and fracturing were encountered in the borings.

Prior to development of a RCRA Facility Investigation (RFI) work plan for SWMU 40, surface and subsurface geophysical investigations were conducted by Geophex Services, Ltd (Geophex, 2001) and Argonne National Laboratory in 2001 and 2002 (ANL, 2003), respectively. Surface geophysical surveys completed included magnetic, electromagnetic, two-dimensional electrical resistivity imaging (2D-ERI), and seismic refraction tomography. Downhole electrical resistivity logging was conducted in borings

40MW2 and 40MW4 along with borehole velocity measurements for the seismic study. The geophysical surveys focused on delineating the lateral and vertical extent of waste and characterizing shallow subsurface conditions below the landfill.

A RCRA Facility Investigation (RFI) is currently being conducted at the site by URS (URS, 2004). A draft report was submitted to the USEPA and the Virginia Department of Environmental Quality (VDEQ) in December 2004 and based on comments received additional investigations will be conducted at SWMU 40 and adjacent SWMU 71 to fill identified data gaps, including:

- Further characterizing the nature and extent of polychlorinated biphenyls (PCBs) in soil north of the landfill area;
- Investigation of the groundwater migration pathway and characterization of groundwater conditions and quality in the immediate landfill area; and
- Further characterizing the nature and extent of metals and PCBs in soil at SWMU 71.

Appendix C.1 of the Draft 2004 RFI provided an in-depth discussion of site geologic and hydrogeologic conditions. It focused on the extent of the landfill material and presents results of the soil boring and test pit sampling program. A detailed comparative analysis of the various geophysical investigations was also completed. For brevity, the information is not re-presented herein but included as Appendix A. This portion of the RFI study concluded that the landfill was originally cited within a sinkhole, which can be observed in the Radford North USGS 7.5-Minute Topographic Quadrangle. Based on the soil boring and test pit sampling program, depth to bedrock interpretations were also developed and presented.

The site is underlain by the Cambrian age Elbrook Formation. The Elbrook Formation is comprised of laminated to thick-bedded dolomite, thin- to medium-bedded limestone, and dolomitic platy shale and siltstone. The average strike and dip of bedrock in the vicinity of the site is approximately 110°/26° to the southwest (URS, 2004).

Bedrock in the vicinity of SWMU 40 is highly karstified with numerous large sinkholes present. A dye-trace study completed by Parsons Engineering Science, Inc. (Parsons) (ES, 1994; Parsons, 1996) indicated that a stream which sinks approximately 200 ft east of SWMU 40 flows westward to a spring on the New River. The spring was named Parsons Spring 3. The dye traveled a distance of 4,800 ft in approximately 24 hours, indicating the presence of an open-flow karst conduit beneath or in the immediate vicinity of SWMU 40.

1.3 TASK OBJECTIVES

The objectives of this geophysical investigation at SWMU 40 are to use 2D-ERI to:

- Evaluate local bedrock structures influencing groundwater flow and potential leachate migration from the landfill waste area; and
- Identify optimal monitoring well locations and depth intervals for monitoring to intercept any potential leachate plume and to detect releases of hazardous constituents to groundwater.

2.0 INVESTIGATION METHODOLOGY

A 2D-ERI survey was conducted by ATS International (ATS), Christiansburg, Virginia under contract to URS on December 11 and 12, 2006. Survey equipment included a Tigre® 64 resistivity system manufactured by Allied Associates, Ltd in Great Britain. Data from two resistivity lines were collected at the site. Electrode spacing for each resistivity line was 5 meters (16.4 ft), and data was collected using the dipole-dipole and pole-dipole arrays with measurements to n=64. Line 1 was placed trending east to west on the north side of SMWU 40. Line 2 was placed trending north to south on the west side of the landfill area. These orientations were intended to provide optimum imaging of karst features and geologic structures at depth in the vicinity of the site, and intercept the anticipated hydraulic gradient to the north and/or west towards the New River. Figure 2 illustrates the resistivity line locations.

Resistivity measurements are collected by applying an electric current into the ground via two electrodes, and simultaneously measuring the potential at two other electrodes with a multi-meter. The dipole-dipole array provides data of significantly higher resolution than the pole-dipole array, while the pole-dipole array provides data to a greater depth. For the dipole-dipole array, a current is applied between two electrodes (current dipole) positioned a predetermined distance apart. The voltage across two other electrodes (potential dipole) is measured simultaneously with the applied current. In the pole-dipole array, an additional electrode (the remote electrode) is placed a large distance from the line of electrodes. A current is applied between the remote electrode and one within the main line of electrodes. The voltage is measured across two other electrodes in the main line of electrodes. The meter was connected via a multi-conductor cable to electrodes placed in the ground. Measurements were initiated at one end of the line and incrementally moved through the electrodes until readings had been taken at every position along the line. The value of n was then increased to add additional resistivity readings at greater depths in the subsurface. The apparent resistivity measurements collected in the field were corrected using the RES2DINV inversion modeling software (see Appendix B).

Electrode locations were flagged and marked in the field and labeled with a unique identifier for future reference. Where satellite coverage was available out of the tree line, the location of each electrode location was surveyed by URS using a Trimble global positioning system (GPS) unit.

The survey was modified from the approved work plan based on field conditions. A two-phased approach was to be used for the survey, varying the electrode spacing and length of lines. Both phases would use a dipole-dipole array. The first phase was to use two short lines in the vicinity of the landfill using an electrode spacing of 10 meters. A second longer set of resistivity lines would then be placed with electrodes at 5 meter intervals to provide high-resolution images of areas identified in the low-resolution lines. In a practical sense, the site has limited space to increase the lines along the intended orientation. Line 2 also had to be moved just west from the proposed location to maintain a straight line orientation around the fenced metals and drum storage area. It was decided to place a single set of high resolution lines with electrodes spaced at 5 meters, and to extend the lines to the maximum length the site would reasonably allow. This also had the advantage of reducing the survey time by removing the step of removal and repositioning electrodes from the low to high resolution configuration. The additional desired depth imaging was then acquired with a second pole-dipole array. Task objectives were obtained using both the dipole-dipole and pole-dipole electrode arrangements for both lines placed at maximum length. The 2D-ERI survey procedures used were consistent with the RFAAP Master Work Plan Standard Operating Procedure 20.7 (URS 2003).

3.0 INVESTIGATION RESULTS

This section summarizes the results of the resistivity survey. The dipole-dipole pseudo-section images for lines 1 and 2 are presented as Figure 3. For a more detailed presentation of results, the reader is referred to Section 4 of the ATS report (Appendix B).

A shallow zone of low resistivity indicative of landfill materials is observed between electrodes 1-32 and 1-56 (Figure 3). Two zones of abnormally low resistivity values (less than 20 Ohm-meters) are also observed in the central portion of the line below the landfill materials. The shallower of these two anomalies occurs at a depth of approximately 60 feet, and is located beneath the area between electrodes 1-32 and 1-35. The deeper anomaly occurs at a depth of approximately 100 feet, and is located beneath the area between electrodes 1-39 and 1-43. Both zones are likely karst features or fracture zones. Their location and the unusually low resistivity values may also suggest the presence of contamination (leachate) associated with the former disposal area. It is reasonable to interpret that one or both of the anomalies in that portion of Line 1 likely represents karst solutional features related to the known buried sinkhole. This interpretation is supported by previous soil boring investigations conducted by URS in 2004 (see Appendix A), and the known sinkhole feature observed on the USGS topographic map of the site which was prepared prior to placement of fill material.

In the western portion of Line 1, numerous small, relatively shallow low-resistivity features are observed which likely represent soil-filled karst features. These features are at a higher elevation than SWMU-40/71, and therefore would not be suitable locations for the placement of monitoring wells. However, a vertically extensive low-resistivity zone is observed beneath electrodes 1-17 to 1-20 which may represent a fracture zone or a larger and deeper karst feature. The central part of this feature is approximately 100 feet below grade and approximately 60 to 70 feet lower than the buried fill materials in SWMU-40.

The results for Line 2 reveal the complex and highly varied nature of the subsurface beneath the site, bearing characteristics typical of highly fractured and highly karstified terrain (Figure3). Numerous anomalies are observed in the section for Line 2, with possible fracture zones identified beneath the vicinities of electrodes 2-13, 2-23, and 2-48 and possible karst features identified beneath electrodes 2-13, 2-38 and 2-48. The interpreted karst feature beneath electrode 2-38 is at an approximate elevation of 1,830 feet, consistent with the elevation of the anomaly previously described beneath electrode 1-18, and also bears the characteristics of a partially soil- or water-filled karst feature. Due to the similarities in elevation and character of these two anomalies, it is possible that they represent a continuation of a karst conduit between those two locations.

As with the pole-dipole dataset for Line 1, the pole-dipole section for Line 2 revealed similar characteristics as the dipole-dipole data, but provided greater depth.

4.0 DISCUSSION OF GEOLOGIC AND HYDROGEOLOGIC CONDITIONS

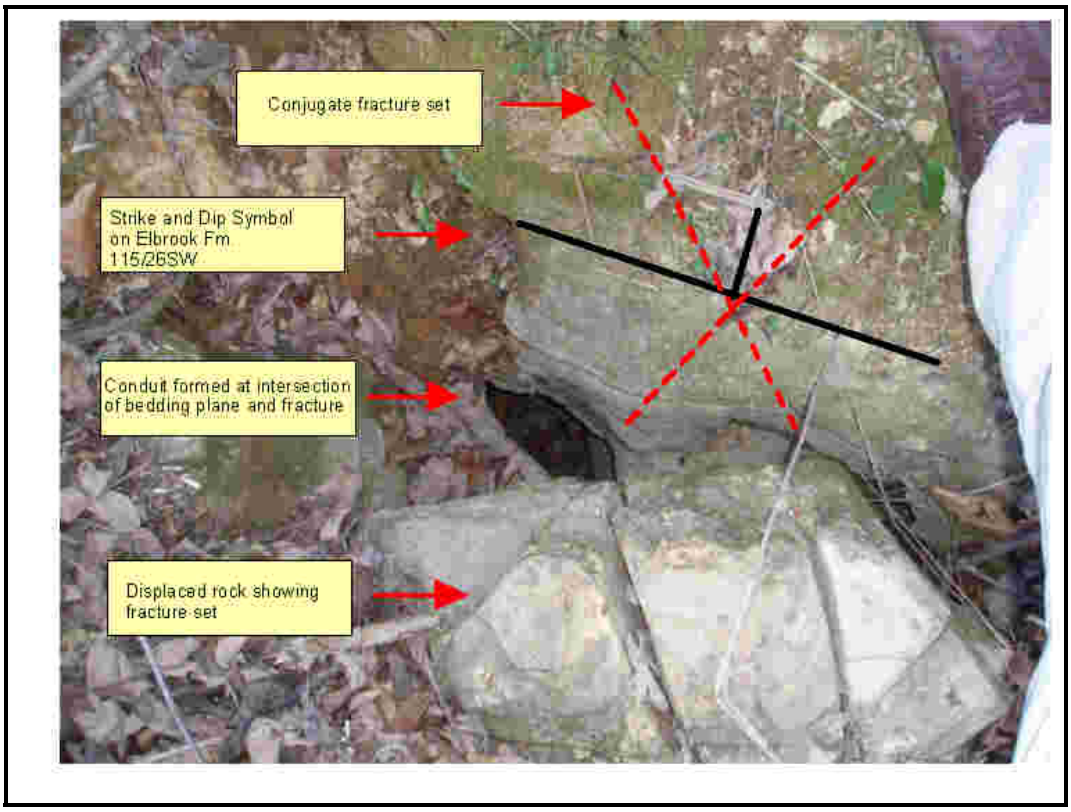
Investigation results identify several low resistivity anomalies that appear to be favorable for monitoring well placement in the immediate vicinity of the landfill. However, a number of considerations must be taken into account to determine optimal well locations, including:

1. The highly variable nature of subsurface conditions and the difficulty in placing wells to intercept preferential groundwater flowpaths developed in karst terrane.
2. Dye from injection point INJ1 at SWMU 17 traveled a minimum straight line distance of 4,800 feet in a day to S136 (Parsons 3 Spring), thus demonstrating the existence of a groundwater conduit(s) beneath the site. The direction of travel appears to be along the predominant average strike of bedrock bedding planes (110°) in the vicinity of the site. Figure 4 provides a close-up of Figure 3-7 prepared by Shaw Environmental, Inc. in the 2005 current conditions report (Shaw, 2005). It illustrates the dye travel path along with various photo-lineament, structural features and sinkhole location interpretations.
3. The Parsons 3 Spring and other springs are located within or in close proximity to the Max Meadows Tectonic Breccia, which outcrops at this location along the New River. The breccia occurs within the fault zone at the base of the Elbrook Formation. The fault in this area is a refolded splay fault structurally above the main décollement for the Pulaski Fault (Schultz, 1986).
4. Low resistivity zones and resistivity contrasts identified at depth at the site can reasonably be assumed to be water saturated karst features indicative of preferential pathways for groundwater flow.

Since geologic and hydrogeologic conditions control groundwater flowpaths, optimal placement of wells is dependent on development of an accurate working hypothesis for selection of well locations and depths.

Results of studies in the Shenandoah Valley indicate caves in the Cambro-Ordovician limestones and dolomites form along the intersections of bedding planes and joints (Harlow et al., 2005; Orndorff and Harlow, 2002). Cave conduits in general form along bedding planes, joints and faults or at the intersection of any two of these (Worthington, 2001). Additionally, sinkholes (and conduits) may preferentially develop along bedding strike with more rapid dissolution of lithologically less resistant rock. This preferential development is more readily expressed as bedding is folded and exposed to weathering. The annotated photograph on the following page illustrates some of these features of sinkhole and conduit formation in the vicinity of SWMU 40.

Conduits typically organize into a structurally controlled dendritic network feeding larger second and third order conduits that outfall to large springs (Worthington, 2001). As the distance from the spring to the perimeter of the recharge area increases, the deeper the groundwater flow, and the larger the spring. Studies in Virginia have shown that even at depths of 100 meters or more, large scale thrust faults in Virginia can be high transmissivity fault zone aquifers (Seaton and Burbey, 2005). These and the other considerations noted above suggest that the groundwater flow underneath SMWU 40 feeding the Parsons 3 Spring area is relatively deep and fed by a conduit(s) developed within or in close proximity to the Pulaski Thrust Fault at the base of the Elbrook Formation. The larger conduit(s) is fed by smaller structurally controlled conduits formed along the intersections of bedding planes and fractures or joints. It is within this context results of the resistivity survey are evaluated and the suitability of low resistivity anomalies assessed as optimal target locations for monitoring wells.



Photograph taken at the bottom of the sinkhole at resistivity line 2, electrode 46. The sinkhole location is noted on Figure 3.

5.0 CONCLUSIONS AND RECOMMENDED MONITORING WELL LOCATIONS

The positive dye trace conducted from the sinkhole at SWMU 17 indicates that an open-flow karst conduit exists beneath or in close proximity to SWMU 40. This information combined with the understanding that SWMU 40 was constructed above a sinkhole suggests groundwater migration from the vicinity of SWMU 40 is likely to be primarily to the west, generally along strike, and primarily through relatively well-developed karst conduits. The resistivity data collected to the north and to the west of SWMU 40 shows bedrock beneath the site is characterized by numerous low-resistivity anomalies which are consistent with bedrock fracture or fault zones and karst-related dissolution features.

A total of seven resistivity anomalies were identified and interpreted by ATS as fracture zones and/or karst features. Two zones of very low resistivity values are observed in the central portion of Line 1 and are interpreted as karst features or fracture zones. The anomalously low resistivity values at these locations may also indicate the presence of contamination associated with the former disposal area. Numerous anomalies are also observed in the section for Line 2, with ATS interpreting possible fracture zones beneath electrodes 2-13, 2-23, and 2-48 and possible karst features identified beneath electrodes 2-13, 2-38 and 2-48. Each of these areas are possible target locations for installation of monitoring wells.

URS recommends placement of two groundwater monitoring wells based on site geologic and hydrogeologic conditions, and the recommendations provided by ATS. Monitoring well 40MW5 is recommended to be placed at electrode 1-34. Monitoring well 40MW6 is recommended to be placed at or in the immediate vicinity of electrode 41. Wells placed at these locations would target the very low resistivity anomalies observed beneath the northern margin of the landfill area, and would likely intercept karst drainage from the probable sinkhole buried beneath SWMU 40. Well 40MW5 and 40MW6 should be completed to minimum depths of 75 and 130 feet, respectively. Figure 5 illustrates the well locations along with other wells in the vicinity of SWMU 40 that would be used during groundwater sampling at the area.

C.0 ASSESSMENT OF SUBSURFACE CONDITIONS

A description of the regional soil, geology, and hydrogeology at RFAAP is presented in Section 3.0 of the MWP (URS, 2003). General information on site-specific conditions, as revealed by previous investigations, is presented in Section 2.0 of this report.

C.1 DATA COLLECTION ACTIVITIES

Historical aerial photographs and previous investigation data were reviewed, and surface and borehole geophysical surveys were conducted by Geophex. These data were used to initially evaluate the potential horizontal and vertical extent of the former Landfill and to locate RFI soil borings, test pits, and follow up geophysical surveys at SWMU 40/71.

Pertinent data points used to evaluate subsurface conditions are shown on Figure C-1. The data points include VI borings and groundwater monitoring wells, RFI soil borings and test pits, and selected bedrock outcrops. Field investigation methods for the RFI data collection activities are discussed in Section 3.4 and RFI field activities are discussed below.

C.1.1 Soil Borings

Sixteen direct-push soil borings were completed to refusal, which presumably occurred on weathered bedrock (see Figure C-1). Boring depths ranged from 6.0 ft bgs (40SB13) to 44.8 ft bgs (40SB4). Summary data for the soil borings completed at SWMU 40/71 are presented in Table C-1. Boring logs are included in Appendix C.2.

C.1.2 Test Pits

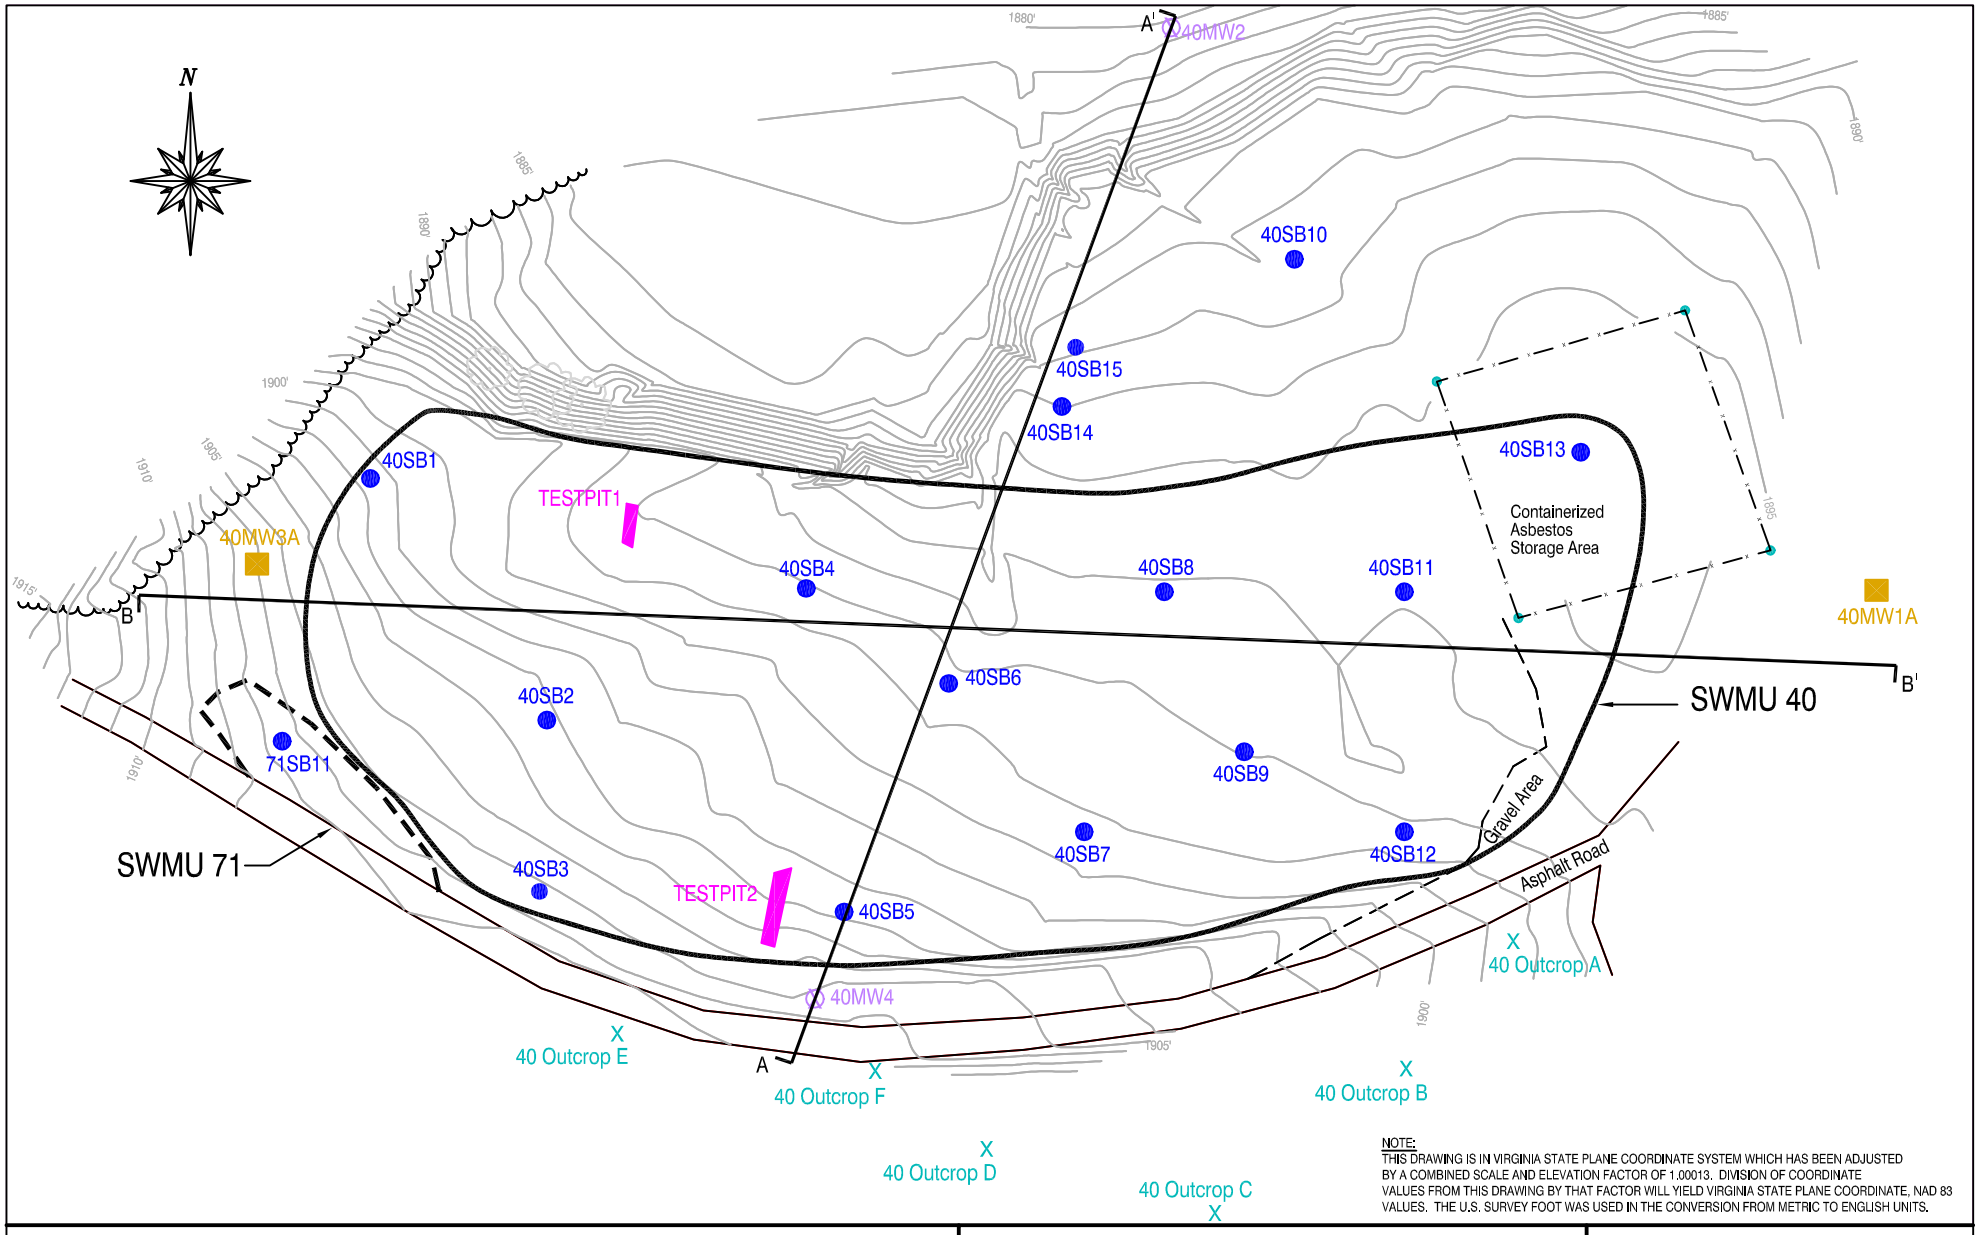
Two backhoe test pits (Test Pit 1 and Test Pit 2) were excavated at areas within SWMU 40 (see Figure C-1). Test pit logs are included in Appendix C.2.

Test Pit 1 was excavated to a depth of 13.7 ft bgs within the northwestern part of SWMU 40 in an area of geophysical anomalies identified by Geophex. Landfill material was encountered in this test pit from a depth of 1 ft bgs to the termination depth. Water seepage from the landfill material into Test Pit 1 was observed at a depth of 11 ft bgs.

Test Pit 2 was excavated to near the southern edge of SWMU 40 to further evaluate the southern extent of landfill material and its nature. This test pit was excavated to refusal on weathered bedrock, which occurred at depths ranging from 4.5 ft bgs (south end) to 13 ft bgs (north end). Approximately 2 ft of landfill material was encountered at the southern end of the test pit, which was underlain by approximately 1 ft of residual soil above weathered bedrock. Approximately 6.5 ft of landfill material was encountered at the northern end of the test pit, which was underlain by 2 ft of residual soil above weathered bedrock. Water seepage was not observed in Test Pit 2.

C.1.3 Physical Soil Testing

Four soil samples from the soil borings were submitted to the URS geotechnical laboratory in Totawa, New Jersey for physical soil testing. Physical testing parameters are described in Table 3-1 and in Section 3.2. Testing results are summarized in Table C-2, with complete analytical results in Appendix C.6.



NOTE:
THIS DRAWING IS IN VIRGINIA STATE PLANE COORDINATE SYSTEM WHICH HAS BEEN ADJUSTED BY A COMBINED SCALE AND ELEVATION FACTOR OF 1.00013. DIVISION OF COORDINATE VALUES FROM THIS DRAWING BY THAT FACTOR WILL YIELD VIRGINIA STATE PLANE COORDINATE, NAD 83 VALUES. THE U.S. SURVEY FOOT WAS USED IN THE CONVERSION FROM METRIC TO ENGLISH UNITS.

Two samples submitted for testing were representative of the surface soil fill material overlying the landfill material at SWMU 40; these samples were collected from borings 40SB4 and 40SB9 at a depth interval of 0 to 4 ft bgs. The remaining two samples submitted for testing were representative of undisturbed naturally occurring subsurface residual soil present below landfill material and above weathered bedrock; these samples were collected from borings 40SB4 (32 to 39 ft bgs) and 71SB11 (3 to 5 ft bgs).

C.1.4 Evaluation of Bedrock Outcrops

Six outcrops of the Cambrian-Age Elbrook Formation were examined during the RFI at locations just south of the asphalt road that runs along the southern boundary of SWMU 40/71 (Figure C-1). Exposed bedrock at the five outcrops was geologically described and the strike and dip of bedding were measured. Outcrop elevation data and strike and dip measurements are summarized in Table C-1 and in Section C.1.4.

C.2 GEOPHYSICAL SURVEYS

Surface geophysical surveys and borehole geophysical logging were performed at SWMU 40/71 by Geophex before preparation of WPA 14. The objectives of the Geophex surveys were to characterize subsurface conditions and develop a preliminary estimate of the extent of the former Landfill.

ANL conducted follow-up geophysical surveys during the RFI, which included both surface and subsurface components. The objectives of the ANL surface survey were to confirm the geophysical models constructed by Geophex, assess the top of weathered bedrock and bedrock, and assist in further definition of the extent of buried material. The objective of the subsurface survey (borehole geophysical logging) was to evaluate subsurface characteristics in two VI monitoring wells to provide control for the surface geophysics.

C.2.1 Geophex Survey - 2001

The Geophex geophysical survey used magnetic, EM induction, and DC resistivity methods. Borehole logging of VI monitoring wells 40MW2 and 40MW4 was conducted using natural gamma ray and EM induction methods (conductivity and resistivity). EM and magnetic surveys were conducted on parallel tracklines spaced at intervals of 5 feet. After analysis of the EM and magnetic data, Geophex completed DC resistivity profiles along eight profile tracklines, which included three generally parallel north-south lines (Nos. 4, 7, and 8), and five generally parallel east-west lines (Nos. 1, 2, 3, 5, and 6). The locations of the geophysical tracklines are shown on Figure C-2.

Potential limits of waste disposal at SWMU 40/71 were mapped by the EM survey, as shown on Figures C-3 (1,050-hertz) and C-4 (170-hertz). Additional discussions of the EM survey and other Geophex survey are presented in Section 2.3.4 (previous investigations), in Section C.3.2 as part of the integrated interpretation of subsurface conditions using geophysical, boring, and test pit data, and in the ANL Geophysical Report included in Appendix D.2.

C.2.2 ANL Survey - 2002

The ANL surface geophysical survey used 2D-ERI and seismic refraction profiling/tomography to evaluate changes in the electrical (2D-ERI) and acoustic (seismic) characteristics of subsurface materials. Borehole velocity surveys were conducted in VI monitoring wells 40MW2 to 57 feet bgs and 40MW4 to

64 feet bgs to provide confirmatory/baseline information concerning the subsurface geologic-material for the seismic refraction models.

The ANL surface geophysical surveys were performed along four profile tracklines at SMWU 40/71 shown on Figure C-2 as described below.

ANL Profile L-2 (see Figure C-5) – Both 2D-ERI and seismic refraction profiling/tomography surveys were performed along this north south profile that connects monitoring wells 40MW2 and 40MW4, which were used as subsurface control points;

ANL Profile L-1 (see Figure C-6) – Both 2D-ERI and seismic refraction profiling/tomography surveys were performed along this north south profile tied to monitoring well 40MW-2;

Geophex Profile L-8 (see Figure C-6) – ANL reprocessed existing Geophex data along this profile and completed a new 2D-ERI survey; and

Geophex Profile L-1 (see Figure C-7) – ANL reprocessed existing Geophex data along this profile and completed a new 2D-ERI survey.

Interpretations of the above profiles and subsurface geophysical data are presented in Sections C.3.1 through C.3.3 as part of the integrated geologic analysis of the geophysical and geotechnical data collected at SWMU 40/71 for the RFI.

C.3 SUBSURFACE CONDITIONS

In addition to the geophysical surveys, subsurface conditions at SWMU 40/71 were evaluated for the RFI through the drilling of 16 soil borings and excavation of two backhoe test pits. In addition, six outcrops of the Elbrook Formation were geologically assessed. The locations of the RFI boreholes, test pits, and bedrock outcrops are shown on Figure C-1.

Subsurface investigations have identified four strata underlying the SWMU 40/71, which consist of from top down: soil fill, landfill material, residual soil, and bedrock. The following sections discuss the nature of these strata and present integrated geological interpretations of the geophysical and geotechnical data collected at SWMU 40/71.

Two geological cross-sections (A-A' and B-B') have been constructed to show the interpreted geologic conditions in the area of SWMU 40/71. Cross-section A-A' is oriented along Profile ANL-2, which runs north south across SWMU 40 between monitoring wells 40MW2 and 40MW4 (see Figure C-8). Cross-section B-B' is oriented along Geophex Profile L-1, which runs east west across the center of SWMU 40 (see Figure C-9).

C.3.1 Soil Fill

Soil fill material is present at the surface and across the area of SWMU 40/71 extending to the base of the scarp located north of SWMU 40. The thickness of fill material encountered at boring and test pit locations ranged from 1 ft at the southern and eastern periphery of SWMU 40 to 11 ft at boring 40SB15 located north of SWMU 40. Within the area of SWMU 40, soil fill material caps underlying landfill material, with a maximum observed thickness of 6.5 ft above the landfill material (see Table C-1). Soil fill material generally consists of dark brown to yellowish brown lean clay (CL) and sandy lean clay (CL) with variable gravel at the surface or near surface. A more extensive area of surface gravel and cinder

FIGURE C-9

Geologic Cross-section B-B'

material is present in the eastern part of SWMU 40 (Cindered Area and Asbestos Storage Area) and in SWMU 71 (see Figure C-1). Geologic cross-sections A-A' and B-B' show the extent and nature of soil fill material across the SWMU 40/71 area in north-south and east-west directions, respectively.

Two representative samples of soil fill material collected from borings 40SB4 and 40SB9 were submitted for physical testing. Samples 40SB4 and 40SB9 were classified as sandy lean clay (CL) with moisture contents in the range of 18 to 19 %. Both samples had low vertical hydraulic conductivities in the range of 10^{-8} to 10^{-9} centimeters per second (cm/sec). Percent organic content was 5.5 % for sample 40SB4 and 2.8 percent for sample 40SB9. Samples 40SB4 and 40SB9 had slightly acidic and basic pH values, respectively (see Table C-2 and Appendix C.6).

C.3.2 Landfill Material

Landfill material underlies soil fill within the area of SWMU 40. In general, this material consists of gray to black clay, sand, gravel, and cinders mixed with abundant paper, glass, plastic, metal, wood chips, rubber, and bagged garbage. Landfill material was described as moist to wet with an odor ranging from sulfurous to strongly acrid and bitter. In some areas, such as boring 40SB6, the landfill material sequence was composed primarily of soil fill with only a minor amount of other types of material. Fluid seepage from landfill material occurred within Test Pit 1, with an accumulation of 2 to 3 ft of water observed in the bottom of the test pit after three hours. Landfill material was described as wet at soil borings 40SB6, 40SB7, 40SB8, and 40SB9 completed near of the center of the landfill area.

Figure C-10 shows the approximately lateral extent and thickness of landfill material as defined by borings and test pits completed at SWMU 40/71. The lateral extent of this material is generally at or within the boundary of SWMU 40. EM surveys conducted by Geophex are in general agreement with the lateral delineation provided by the borings and test pits; the exception being the 170-hertz EM survey, which appears to overestimate the lateral extent of landfill material at the eastern and northern periphery of SWMU 40 compared with the boring data (see Figures C-3 and C-4).

The observed thickness of landfill material ranged from 5.1 ft (boring 40SB1) to 14.5 ft (boring 40SB4). In general, the thickness of landfill material increases from the western, southern, and eastern periphery of SWMU 40 toward the central and northern part of SWMU 40 (see Figure C-10). The top surface of the landfill material generally slopes northeastward across SWMU 40 from an elevation of 1,900 ft msl to 1,890 ft msl; the exception being in the eastern third of SWMU 40 where a slight slope toward the north is apparent (see Figure C-11). Soil boring and test pit investigations confirm that earlier interpretations of 2D-ERI data by Geophex had significantly overestimated the thickness of landfill material; thereby supporting the ANL hypothesis that the presence of broad zones of low-resistivity (< 20 ohm/m) in the 2D-ERI survey were likely related to features in weathered bedrock, such as clay zones (ANL, 2003).

Table C-3 presents volume estimates of landfill material at SWMU 40. Based on the landfill thickness data collected from the borings and test pits, approximately 20,300 cubic yards of landfill material may be present at SWMU 40.

Geologic cross-sections A-A' and B-B' show the extent and nature of landfill material across the SWMU 40/71 area in north-south and east-west directions, respectively.

C.3.3 Residual Soil

Residual soil, which has weathered in place from argillaceous carbonate bedrock, underlies landfill material at SWMU 40/71. Outside of the landfill area, residual soil underlies soil fill material. The contact with overlying fill is sharp and is more gradational with underlying weathered rock. Residual soil generally consists of brown to yellowish red clay (CL or CH) with variable sand content and occasional gravel.

Four physical samples of residual soil (VI and RFI) were laboratory classified as CL or CH (see Table C-2). Both RFI physical samples (40SB4 and 71SB11) had low vertical hydraulic conductivities in the range of 10^{-7} to 10^{-8} cm/sec. The organic content of the RFI samples was 3 to 4%, with a slightly acidic pH.

The observed thickness of residual soil within the SWMU 40/71 area ranged from 1 to 27 ft, with an increase in thickness generally observed toward the northern and eastern boundary of SWMU 40 (see Figure C-12). The isopach map shown as Figure C-12 is considered to represent the minimum thickness of residual soil present at the boring locations investigated; since it is assumed that boring refusal by the direct-push unit represents the top of weathered rock. Bedrock outcrops occur south of SWMU 40, where the residual soil unit is absent.

The top surface of the residual soil generally slopes northward across SWMU 40 toward the north central boundary of SWMU 40 (see Figure C-13). This pattern suggests that a single excavation or fill area existed over the majority of the SWMU rather than separate trenches into natural residual soil as originally thought.

Geologic cross-sections A-A' and B-B' show the extent and nature of residual soil across the SWMU 40/71 area in north-south and east-west directions, respectively.

C.3.4 Bedrock

Previous investigations at SWMU 40/71 indicate that argillaceous carbonate bedrock of the Elbrook Formation underlies the area of SWMU 40/71 (Dames & Moore, 1992). VI borings 40MW1A, 40MW2, 40MW-3, and 40MW4 penetrated 43 to 160 ft of limestone and dolomite bedrock at the periphery of SWMU 40/71 (see Appendix C.1). Bedrock generally consists of light gray to bluish gray limestone or dolomite with some interbedded brown siltstone. Depth to bedrock in the VI borings ranged from 2 to 17 ft bgs (see Table C-1). Several outcrops of bedrock occur immediately south of SWMU 40/71. Strike and dip measurements obtained at five outcrops indicate bedrock strikes in the range of 110 to 115° with bedrock dips ranging from 12 to 16° (see Table C-1).

The consistency of bedrock encountered in the VI borings ranged from soft to hard with numerous zones of intense weathering and fracturing. Clay filled weathered zones and voids were encountered in each of the VI borings, with notable voids and/or weathering at the completion depth of borings 40MW2, 40MW3A, and 40MW4. Zones of more competent bedrock were encountered in boring 40MW1A at depths below the completion depths of the other borings.

In general, weathered bedrock underlies residual soil at SWMU 40/71. The contact between residual soil and weathered bedrock may be abrupt or gradational over several feet, depending on the degree of weathering. For purposes of the RFI intrusive investigation, direct-push boring or test pit refusal was assumed to represent the top of weathered bedrock. However, the upper surface of

FIGURE C-14

**Structural Contour Map-
Top of Weathered Bedrock**

weathered bedrock may be identified at deeper depths with other drilling techniques or by geophysical surveys such as seismic refraction tomography.

The depth of soil boring refusal ranged from 6.2 ft bgs (boring 40SB13) to 44.8 ft bgs (boring 40SB4). Based on the soil boring and test pit data, the elevation of top of weathered bedrock ranges from 1,912 ft msl at the bedrock outcrop area to less than 1,852 ft msl in the north central part of SWMU 40 (see Figure C-14). In general, the weathered bedrock surface slopes from the western, southern, and eastern periphery of SWMU 40/71 toward the north central border of SWMU 40. An apparent depression in the weathered bedrock surface occurs in the area of boring 40SB4, where approximately 45 feet of overburden overlies bedrock (see Figure C-14).

ANL performed borehole velocity surveys in existing VI monitoring wells 40MW2 and 40MW4 to provide control for the surface tomography surveys. In Well 40MW2, seismic velocities increased from approximately 1,900 feet per second (ft/s) to 5,000 ft/s at a depth of approximately 25 ft bgs indicating a change from residual soil to weathered rock. Seismic velocities did not increase at greater depths indicating that a significant degree of weathering was present in the bedrock sequence at this location. At Well 40MW4, an increase in seismic velocity from 2,500 ft/s to 10,000 ft/s occurred at a depth of approximately 25 feet bgs indicating a change from residual soil/weathered bedrock to competent bedrock.

Geophex performed geophysical logging in wells 40MW2 and 40MW4. Gamma logging in 40MW2 indicated three general zones (0-28, 28-49, and >49 feet bgs) that appear to correspond to residual soil (upper zone), weather bedrock (middle zone), and competent bedrock (lower zone). Increased conductivity was also measured at the transition points of the major zones. In the MW404 logs, two general zones were present, 0-30 and >30 feet bgs, with the upper zone corresponding to residual soil and the lower zone with bedrock containing zones of weathered material through the sequence. Summary borehole geophysical logs are shown on the ANL surface geophysical profiles presented in Figures C-5 and C-6.

Geologic cross-sections A-A' and B-B' show the configuration of the weathered bedrock surface as inferred from the soil borings, monitoring well borings, and test pit data. The top of weathered bedrock and top of bedrock inferred from the ANL seismic survey was plotted on these cross-sections to show the differences in the inferred bedrock surface with the different data platforms.

Cross-Section A-A' (Figure C-8) and ANL Profile L-2 (Figure C-5)

Boring data across this profile within the landfill area generally indicates a 5 to 15 ft shallower depth to weathered bedrock than ANL seismic surveys. The weathered bedrock surface modeled by the seismic survey mimics the surface inferred from the soil boring and test pit data; both platforms indicate that bedrock slopes from south to north across the profile on Figure C-8. The seismic survey models the weathered bedrock surface approximately 5 ft higher than suggested by the boring data at locations north of the landfill area and boring 40SB15, except in the area of 40MW2 where this difference is reversed. At the extreme southern end of the profile, the seismic survey indicates a shallower depth to weathered bedrock than that inferred from the boring data.

The 2D-ERI and seismic surveys model weathered bedrock at similar depths at the northern and southern ends of the profile (see Figure C-5). A discrepancy exists between the 2D-ERI dipole-dipole and seismic models within the landfill area. The dipole-dipole solution suggests a major depression in the weathered bedrock surface to depths of 70 to 80 ft bgs contrasted with the 30 to 40 ft bgs projected by the seismic model (see Figure C-5). In this area, the 2D-ERI Schlumberger and seismic models predict a similar

depth to weathered bedrock. The weathered bedrock surface modeled by seismic data and boring data cut through the bedrock low modeled by the dipole-dipole solution. This suggests that clay zones, or other sources of low resistivity present within the bedrock are the cause of the broad zone of low resistivity rather than the presence of landfill material or residual soil.

Cross-Section B-B' (Figure C-9) and Geophex Profile L-1 (Figure C-7)

Boring data across this profile indicate that the surface of weathered bedrock slopes from the eastern and western edges of SWMU 40 toward a bedrock low in the area of soil boring 40SB4. Projected surfaces of weathered bedrock and bedrock are also shown on Figure C-7, as modeled from seismic data along profiles ANL-1/Geophex and ANL-2 where they intersect Geophex L-1. Projections from seismic and boring data are in close agreement from 225X eastward on Figure C-7, with a 3 to 7 ft shallower depth to weathered bedrock indicated by the boring data. Weathered bedrock surfaces projected by seismic and boring data intersect in the area of the bedrock low (165X to 200X). Seismic projections of a level bedrock surface extending to the west of the bedrock low do not correlate with boring data, which indicate an upward sloping weathered bedrock surface from boring 40SB4 to 40MW3A. The bedrock surface modeled by ANL reprocessing of the Geophex 2D-ERI data (dipole-dipole) along L-1 closely correlates with the boring data in this area (see Figure C-7).

Reprocessing of the Geophex 2D-ERI data along L-1 still shows a thick zone of low resistivity in the eastern third of the model. The weathered bedrock surface inferred from the boring data and predicted by the seismic data along this profile cut through the zone of low resistivity. Similar to profile ANL-2, clay zones or other sources of low resistivity present within the bedrock are the likely cause of this broad zone of low resistivity rather than the presence of landfill material or residual soil.

The 2D-ERI data generated by ANL during its reoccupation of Geophex L-1 models bedrock as a high-resistivity zone (>400 ohm-m) with a relatively horizontal top at approximately 1,860 ft msl and slight westward dip of 15 ft over the length of the profile (ANL, 2003). This model is in reasonable agreement with the bedrock surface projected by the seismic data across the profile.

Profiles ANL L-1 and Geophex L-8 (Figure C-6)

The seismic survey along ANL L-1 models a weathered bedrock surface that closely agrees with the elevations and bedrock configuration presented on the structural contour map of weathered bedrock (see Figure C-14). Both data platforms indicate a northward sloping weathered bedrock surface toward Monitoring Well 40MW2.

Reprocessing of the Geophex 2D-ERI data (dipole-dipole) along L-8 indicates that the bedrock surface modeled by resistivity is deeper than that predicted by seismic; the exception being at the northern and southern ends of the profile where the models are in close agreement. There is a larger discrepancy between these models between 100 and 150X, where the resistivity model suggests that landfill material may be present to depths of 40 ft. The weathered bedrock surface modeled by seismic data and boring data cut through this low-resistivity zone; thus, this zone of low-resistivity cannot be attributed to landfill material and is likely related to features of the underlying bedrock.

C.4 Geologic Summary

The shallow geology at SWMU 40/71 generally consists of fill materials overlying natural deposits. SMWU 40, a former landfill, appears to be a laterally contiguous disposal area overlying residual soil, filled with various types of landfill materials, soil, and cinders, and then capped by emplacement of soil fill. The soil fill consists of generally fine-grained materials (sandy clay and clay) that contain lenses of gravel, sand, and cinders. A surface veneer of cinders is present in the eastern portion of SWMU 40. Soil fill at SWMU 71 is mixed with cinders and rests directly upon residual soil.

Residual soil is present beneath the entire landfill and consists of fine-grained material, principally slightly sandy clay, derived from the inplace weathering on the underlying Cambrian-Age Elbrook Formation argillaceous carbonates. The residual soil grades downward into weathered bedrock that, in turn, grades downward into competent carbonate bedrock that contains fractures, cavities, vugs, and other solution features.

A karst depression, potentially a sinkhole or enlarged fracture, in the carbonate bedrock appears to be present in the area of soil boring 40SB4 (see Figures C-9, C-12, and C-14). Relief of at least 15+ ft on the weathered bedrock surface appears to be present in this area; relief is greater (25+ ft) to the northeast where the apparent shallow depth of weathered bedrock at boring 40SB14 may indicate the presence of a karst pinnacle. The depression contains the thickest sequence of residual soil at SWMU 40/71; one of the thinnest natural sequences, i.e. no excavation in the area, is present at boring 40SB14 (Refer to Figure C-12).

The lateral and vertical extent of landfill material in SWMU 40 has been defined through the combination of surface geophysics and subsurface data. Surface geophysics identified the top of weathered bedrock and competent bedrock that varied greatly in depth across the SWMU. Along some profiles, general geophysical trends appear to correspond to elevation configurations projected from soil boring data, but deviations in projected depths of the weathered bedrock surface were present.

Executive Summary

ATS International, Inc. (ATS) was retained by the URS Corporation (URS) to perform a resistivity imaging study at SWMU-40/71, located within the Radford Army Ammunition Plant (RFAAP) near Radford, Virginia. The objective of this study was to identify drilling targets for the installation of additional monitoring wells in the vicinity of SWMU-40/71. The tasks involved in this study included:

(1) Collection and processing of resistivity imaging data.

(2) Integration and synthesis of geologic data from previous studies into interpretation of new resistivity data for most comprehensive interpretation of new data.

(3) Preparation of this document detailing our methods and findings.

The site and immediate surroundings are underlain by the Cambrian-aged Elbrook Formation, which is comprised of laminated to thick-bedded dolomite, thin- to medium-bedded limestone, and dolomitic platy shale and siltstone. The strike of bedrock in the vicinity of the site is approximately 110°. Within a sinkhole located approximately 250 feet southwest of SWMU-40/71, bedrock was observed to dip approximately 10 to 30 degrees to the south-southwest.

The bedrock subsurface in the vicinity of SWMU-40/71 is highly karstified, with numerous large sinkholes and sinking streams present. In 1996, a dye-trace study revealed that a stream which sinks approximately 200 feet east of SWMU-40/71 flows westward to a spring on the New River. In that study, the dye traveled a distance of 4,800 feet in approximately 24 hours, indicating the presence of an open-flow karst conduit beneath the vicinity of SWMU-40/71.

Data from two resistivity lines were collected at the site. Line 1 was located just north of SWMU-40/71 and was oriented in an east-west direction, while Line 2 was located just west of SWMU-40/71 and was oriented in a northeast-southwest direction.

Leachate from leaking landfills typically results in vertically or laterally extensive zones of abnormally low resistivity values extending from the landfill area. Two zones of abnormally low resistivity values (with values as low as 20 Ohm-meters) are observed in the central portion of Line 1 which may suggest the presence of contamination associated with the former disposal area(s). The nature of these anomalies also suggests that they are located within interpreted karst features or fracture zones.

Of additional note is that the Radford North USGS 7.5-minute topographic quadrangle, which illustrates the surface topography prior to the creation of SWMU-40/71, indicates the prior existence of an enclosed depression (i.e. sinkhole) immediately beneath the current location of SWMU-40/71. Based on this information, it is reasonable to interpret that one or both of the anomalies in that portion of Line 1 likely represent(s) karst solutional features related to that buried sinkhole.

Numerous anomalies are observed in the section for Line 2, with possible fracture zones identified beneath the vicinities of electrodes 2-13, 2-23, and 2-48 and possible karst features identified beneath electrodes 2-13, 2-38 and 2-48.

A total of seven resistivity anomalies are identified as interpreted fracture zones and/or karst features. Each of these anomalies may represent possible locations for intercepting groundwater through the installation of a monitoring well. The selection of monitoring well locations should take into account the 3-dimensional heterogeneity of the karst subsurface, with special consideration given to the fact that groundwater migration through potentially open-flow karst from the vicinity of SWMU-40/71 is not likely to follow normally intuitive parameters.

The fact that a positive dye trace was conducted from the sinkhole at SWMU-17 (on the east side of SWMU-40/71) almost due west to the New River reveals that an open-flow karst conduit exists beneath the vicinity of SWMU-40/71. Given this information, combined with the fact that SWMU-40/71 was evidently constructed immediately above a sinkhole, it is reasonable to expect that groundwater migration from the vicinity of SWMU-40/71 would be primarily to the west, generally along strike, and primarily through relatively well-developed karst conduits.

1. Introduction

ATS International, Inc. (ATS) was retained by the URS Corporation (URS) to perform a resistivity imaging study at SWMU-40/71, located within the Radford Army Ammunition Plant (RFAAP) near Radford, Virginia (Figure 1). SWMU-40/71 is located in the southern portion of the RFAAP property, approximately seven tenths of a mile northwest of the RFAAP Main Entrance on VA Route 114 (Figure 2).

Detailed geophysical studies have been conducted previously at SWMU-40/71 by Geophex Services, Ltd. (May 2001) and Argonne National Laboratory (April 2003). The objectives of those investigations were to characterize the subsurface beneath SWMU-40/71 and to identify the lateral and vertical extents of waste.

The objective of this study was to identify drilling targets for the installation of additional monitoring wells in the vicinity of SWMU-40/71. The tasks involved in this study included:

(1) Collection and processing of resistivity imaging data.

(2) Integration and synthesis of geologic data from previous studies into interpretation of new resistivity data for most comprehensive interpretation of new data.

(3) Preparation of this document detailing our methods and findings.

2. Site Geology

The site is located within the Valley and Ridge Province, which consists of elongate parallel mountain ridges and valleys that are underlain by folded and faulted Paleozoic sedimentary bedrock. These parallel ridges and valleys are the result of differential weathering of layered clastic and carbonate rocks.

The site and immediate surroundings are underlain by the Cambrian-aged Elbrook Formation, which is comprised of laminated to thick-bedded dolomite, thin- to medium-bedded limestone, and dolomitic platy shale and siltstone (Figure 3). The strike of bedrock in the vicinity of the site is reported to be approximately 110°. Within a sinkhole located approximately 250 feet southwest of SWMU-40/71, bedrock was observed to dip approximately 10 to 30 degrees to the southwest.

The bedrock subsurface in the vicinity of SWMU-40/71 is highly karstified, with numerous large sinkholes and sinking streams present. With the local abundance of sinking streams, well-developed cave systems should be expected through which groundwater can travel very rapidly, both vertically and laterally.

This condition is evidenced locally in the large sinkhole approximately 200 feet east of SWMU-40/71, in which SWMU-17 is located. A surface stream sinks into the karst subsurface in the southwestern edge of that sinkhole, and its drainage has been positively dye-traced to a spring on the New River approximately 4600 feet to the west of SWMU-40/71 (ES 1994, Parsons 1996). In that study, the dye traveled a distance of 4,800 feet in approximately 24 hours, indicating the presence of an open-flow karst conduit beneath the vicinity of SWMU-40/71. The spatial relationship between the dye injection point and the observed outflow at the river suggests a strike-oriented flow pathway. This is supported by the shape and distribution of local sinkholes, suggesting that local karstification may be strongly influenced by the strike of the lithologic bedding.

3. Resistivity Imaging

Resistivity imaging provides cross-sectional images of the resistance to electric current. Electrical resistivity is a fundamental parameter of the material that describes how easily the material can transmit electrical current. High values of resistivity imply that the material is very resistant to the flow of electricity; low values of resistivity imply that the material transmits electrical current very easily.

The primary factors affecting the resistivity of earth materials are porosity, water saturation, clay content, and ionic strength of the pore water. In general, the minerals making up soils and rock do not readily conduct electric current and thus most of the current flow takes place through the material's pore water. The relatively high levels of pore water in soils and other unconsolidated materials tend to give low resistivity values for the shallow subsurface. Where the levels of pore water in soils and other unconsolidated materials are low, resistivity values tend to be high in the shallow subsurface.

3.1. Principals of Resistivity

Experiments by Gorge Ohm in the early 19th century revealed the empirical relationship between the current flowing through a material and the potential required to drive that current. This relationship is described by

$$V = IR$$

where V is voltage in volts, I is the current in amperes, and R is the proportionality constant. Rearranging the equation to

$$\frac{V}{I} = R$$

gives resistance with the units of volts divided by amperes, or ohms.

The resistance of a material is dependent not only on the property of the material but also the geometry of the material. Specifically, a longer travel path for the current or smaller cross-

sectional area would cause the resistance to increase. The geometry-independent property used to quantify the flow of electric current through a material is resistivity, given by

$$\rho = \frac{RA}{L}$$

where ρ is the resistivity, R is the resistance, A is the cross-sectional area through which the current flows, and L is the length of the current flow path. With all length units expressed as meters, the units associated with resistivity are ohm - meters (ohm - m).

3.2. Field Methods

For any two-dimensional resistivity survey, a series of electrodes is placed in the ground in a straight line with a uniform spacing between electrodes. Resistivity measurements are accomplished by applying an electric current into the ground via two electrodes, and simultaneously measuring the potential at two other electrodes. Numerous configurations (or arrays) of electrode placement are commonly employed, each with unique data characteristics. For this study, data were collected using the dipole-dipole array and the pole-dipole array. The dipole-dipole array provides data of significantly higher resolution than the pole-dipole array, while the pole-dipole array provides data to a greater depth.

For the dipole-dipole array, a current is applied between to two electrodes (current dipole) positioned a predetermined distance apart (distance *a*). The voltage across two other electrodes (potential dipole) is measured simultaneously with the applied current. The electrodes in each dipole are always spaced distance *a* apart and the distance between the current dipole and the voltage dipole is always a multiple of *a* ($n \bullet a$). In the pole-dipole array, an additional electrode (the remote electrode) is placed a large distance from the line of electrodes. A current is applied between the remote electrode and one within the main line of electrodes. The latter is called the local current electrode. The voltage is measured across two other electrodes placed a distance *a* apart. The distance between the local current electrode and the voltage electrodes is always a multiple of *a* ($n \bullet a$). To obtain apparent resistivity values, the voltage and current measurements are input into the following formula for dipole-dipole surveys

$$\rho = 2\pi(n+1)\cdot(n+2)\cdot a \cdot \frac{V}{I}$$

and the following formula for the pole-dipole array:

$$\rho = 2\pi a \cdot n(n+1)\frac{V}{I}$$

Resistivity data were collected using a Tigre® 64 computerized resistivity system manufactured by Allied Associates, Ltd in Great Britain. The resistivity meter was connected via a multi-conductor cable to electrodes placed in the ground. Measurements were initiated at one end of the line and incrementally moved through the electrodes until readings had been taken at every

position along the line. The value of *n* was then increased to add additional resistivity readings at greater depths in the subsurface.

Data from two resistivity lines were collected at the site. Line 1 was located just north of SWMU-40/71 oriented in an east-west direction, and Line 2 was located just west of SWMU-40/71 oriented in a northeast-southwest direction (Figure 4).

Each resistivity line employed a spacing of five meters (16.4 feet) between electrodes. The electrodes were assigned a unique identifier that consisted of the line number followed by a dash and the electrode number. For example, the first electrode on Line 1 was identified as 1-1, the first electrode on Line 2 as 2-1, etc. The elevation of each electrode was taken from the surface topography data in the site plans provided by URS (CAD file entitled "40-71 area only.dwg") so that the resulting resistivity sections would include the local topographic relief. The elevation information was also used in the inversion modeling process as changes in elevation influence the inversion results.

3.3. Inversion Modeling

The resistivity measurements on a section are called apparent resistivities. They may differ from the actual resistivities because the measured data may be affected by passage through inhomogeneous materials and the distance of travel through the media. Therefore, linear inversion techniques were applied to the data using RES2DINV inversion modeling software. Linear inversion modeling fits the measured data in the resistivity section to an earth model that may represent the actual resistivities in the section. The inversion modeling is completed by calculating apparent resistivity from the earth model for comparison to the measured data. If the comparison is within reasonable limits, the earth model can be accepted as an approximation of subsurface conditions. Details of the inversion process may be found in Lines and Treitel (1984), Loke and Barker (1995), and Loke and Barker (1996).

4. Resistivity Results

Because the dipole-dipole array generates a model of higher resolution than that of the pole-dipole array, results of the dipole-dipole array will be discussed first.

4.1. Line 1

The resulting section for Line 1 illustrates a shallow zone of low resistivity values between electrodes 1-32 and 1-56 (Figure 5). This zone is coincident with the area of backfill observed on the ground surface and in geophysical interpretations from previous studies at the site. Monitoring well 40MW2 is graphically projected onto the section for Line 1, although it is located approximately 26 feet north of Line 1.

Landfill materials and leachate typically exhibit resistivity values that are significantly lower than natural earth materials. Two zones of abnormally low resistivity values are observed in the central portion of the line, with values as low as 20 Ohm-meters. The shallower of these two anomalies occurs at a depth of approximately 60 feet, and is located beneath the area between electrodes 1-32 and 1-35. The deeper anomaly occurs at a depth of approximately 100 feet, and is located beneath the area between electrodes 1-39 and 1-43.

Leachate from leaking landfills typically results in vertically or laterally extensive zones of abnormally low resistivity values extending from the landfill area. The unusually low resistivity values seen in Line 1 may suggest the presence of contamination associated with the former disposal area(s). The shape and distribution of these anomalies also suggest that they may be located within karst features or fracture zones.

Of additional note is that the Radford North USGS 7.5-minute topographic quadrangle presented in Figure 2, which illustrates the surface topography prior to the creation of SWMU-40/71, indicates the prior existence of an enclosed depression (i.e. sinkhole) immediately beneath the current location of SWMU-40/71. Based on this information, it is reasonable to interpret that one or both of the anomalies in that portion of Line 1 likely represent(s) karst solutional features related to that buried sinkhole. This possible interpretation is supported by previous soil boring investigations conducted by URS (2004), which showed a significant increase in depth to bedrock in this area in boring 40SB4. A bedrock pinnacle was also noted nearby in boring 40SB14. These borings are located approximately 60 feet and 20 feet south of Line 1, respectively.

In the western portion of Line 1, numerous small, relatively shallow low-resistivity features are observed which likely represent soil-filled karst features. These features are at a higher elevation than SWMU-40/71, and therefore would not be suitable locations for the placement of monitoring wells. However, a vertically extensive low-resistivity zone is observed beneath electrodes 1-17 to 1-20 which may represent a fracture zone or a larger and deeper karst feature.

The pole-dipole data for Line 1 provided data to a depth of approximately 350 feet. Its characteristics generally mimic those of the dipole-dipole data, with the exception of the anomaly just described. With the added depth of data provided, the resistivity contour values enclose around that anomaly beneath the vicinity of 1-18, rendering it more characteristic of a partially soil- or water-filled karst feature rather than a fracture zone. This anomaly is at an approximate elevation of 1835 feet, approximately 60 to 70 feet lower than the buried fill materials in SWMU-40/71. Two deeper low-resistivity anomalies are observed at the bottom of the section. These occur at an approximate elevation of 1650 feet MSL and are therefore below the level of the New River. As such, they are not considered relevant to this study.

4.2. Line 2

The results for Line 2 reveal the complex and highly varied nature of the subsurface beneath the site, bearing characteristics typical of highly fractured and highly karstified terrain (Figure 6). Numerous anomalies are observed in the section for Line 2, with possible fracture zones

identified beneath the vicinities of electrodes 2-13, 2-23, and 2-48 and possible karst features identified beneath electrodes 2-13, 2-38 and 2-48.

The interpreted karst feature beneath electrode 2-38 is at an approximate elevation of 1830 feet, consistent with the elevation of the anomaly previously described beneath electrode 1-18, and also bears the characteristics of a partially soil- or water-filled karst feature. Due to the similarities in elevation and character of these two anomalies, it is possible that they represent a continuation of a karst conduit between those two locations.

As with the pole-dipole dataset for Line 1, the pole-dipole section for Line 2 revealed similar characteristics as the dipole-dipole data, but provided greater depth.

5. Existing Monitoring Wells

The locations of existing monitoring wells in the immediate vicinity of SWMU-40/71 – as indicated in CAD drawings provided to ATS by URS – are presented in Figure 3, and are identified as 40MW2, 40MW3 and 40MW4. Because of their proximity to Lines 1 and 2, monitoring wells 40MW2 and 40MW3 were plotted graphically onto the resistivity sections so that their proximity to resistivity anomalies could be evaluated. It should be noted, however, that the map in Figure 3 indicates that 40MW3 is located between electrodes 2-4 and 2-5, while in the field, 40MW3 is located approximately 40 feet northwest of that location.

6. Recommendations for Additional Monitoring Wells

The resistivity data collected to the north and to the west of SWMU-40/71 reveals that the bedrock subsurface beneath the site is of a highly varied and complex nature, and is characterized by numerous low-resistivity anomalies which are consistent with bedrock fracture or fault zones and karst-related dissolution features. A total of seven resistivity anomalies have been specifically identified in Figures 5 and 6 as interpreted fracture zones and/or karst features. Possible karst features which could be expected beneath the site may include completely soil-filled cavernous voids, laterally extensive open-air cavernous voids (which are at least partially filled with highly conductive soils and/or water), and open-flowing bedrock stream conduits as would be expected to exist in association with the sinking stream located just east of SWMU-40/71 (at the south end of SWMU-17).

Each of these areas may represent possible locations for intercepting groundwater through the installation of a monitoring well. The selection of monitoring well locations should take into account the 3-dimensional heterogeneity of the karst subsurface, with special consideration given to the fact that groundwater migration through potentially open-flow karst from the vicinity of SWMU-40/71 is not likely to follow normally intuitive parameters.

The fact that a positive dye trace was conducted from the sinkhole at SWMU-17 (on the east side of SWMU-40/71) almost due west to the New River reveals that an open-flow karst conduit exists beneath the vicinity of SWMU-40/71. Given this information, combined with the fact that SWMU-40/71 was evidently constructed immediately above a sinkhole, it is reasonable to

expect that groundwater migration from the vicinity of SWMU-40/71 would be primarily to the west, generally along strike, and primarily through relatively well-developed karst conduits.

As such, several recommendations for additional monitoring well locations have been provided. The locations are listed in the table below, and refer to the electrode flag numbers which were placed in the field:

Line 1	Line 2
1-18.5	2-13
1-33.5	2-23
1-41	2-38
	2-48

At a minimum, we recommend that a monitoring well be placed along Line 1, either at electrode 1-33.5 (i.e. halfway between 1-33 and 1-34) or at electrode 1-41. If the direction of groundwater migration from SWMU-40/71 were at all to the north, then a monitoring well placed at either of these locations would be likely to intercept karst drainage from the probable sinkhole buried beneath SWMU-40/71, and therefore likely to bear any dissolved constituents associated with the disposed material. If the location at electrode 1-33.5 is drilled, it should be completed to a minimum depth of 100 feet. If the location at 1-41 is drilled, it should be completed to a minimum depth of 130 feet.

Based on the resistivity results and the body of data for the site, monitoring wells drilled on Line 2 at electrodes 2-23, 2-38, and 2-48 would be most likely to intercept westerly groundwater flow from SWMU-40/71. The low-resistivity anomaly beneath 2-13 would likely intercept groundwater, but drilling this location would not be necessary if a monitoring well is placed at 1-41 and/or 1-33.5.

Due to terrain or other site restraints present at some of the suggested drilling targets, it may be desirable to drill targets not listed above, including locations which may not lie directly on the two resistivity lines. Doing so may still intercept groundwater and achieve the desired results; however, this would be at your discretion.

Table E.1-1
Selection of Exposure Pathways - SWMU 40
SWMUs 40 and 71 RFI/CMS Report
Radford Army Ammunition Plant, Radford, Virginia

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Current	Surface Soil	Surface Soil	Surface Soil	Maintenance Worker	Adult	Ingestion	Quant	Receptor could ingest surface soil from the site while conducting routine maintenance activities (i.e., mowing lawns).
						Dermal Absorption	Quant	Receptor could come into contact with surface soil from the site while conducting routine maintenance activities (i.e., mowing lawns).
		Air	Ambient Air Above Surface Soil (Particulates and Vapors)	Maintenance Worker	Adult	Inhalation	Quant	Receptor could inhale particulates and vapors from ambient air above the surface soil.
	Subsurface Soil	Subsurface Soil	Subsurface Soil	Maintenance Worker	Adult	Ingestion	None	Receptor is not likely to ingest subsurface soil from the site since maintenance does not include excavation.
						Dermal Absorption	None	Receptor is not likely to come in contact with subsurface soil from the site since maintenance does not include excavation.
		Air	Ambient Air Above Subsurface Soil (Particulates and Vapors)	Maintenance Worker	Adult	Inhalation	None	Receptor is not likely to inhale particulates and vapors from ambient air above the subsurface soil since maintenance activities do not include excavation.
	Groundwater [1]	Groundwater	Groundwater	Maintenance Worker	Adult	Ingestion	None	Receptor is not likely to ingest groundwater from the site during maintenance activities.
						Dermal Absorption	None	Receptor is not likely to contact groundwater from the site during maintenance activities.
		Air	Upward Migration of Vapors from Groundwater (Outdoors)	Maintenance Worker	Adult	Inhalation	None	Receptor is not likely to inhale vapors that migrated upward from groundwater to ambient air in any significant quantities.
			Upward Migration of Vapors from Groundwater (Indoors)	Maintenance Worker	Adult	Inhalation	None	Receptor is assumed to be outdoors.
			Vapors while Showering	Maintenance Worker	Adult	Inhalation	None	Receptor is assumed not to shower on-site.
Future	Surface Soil	Surface Soil	Surface Soil	Maintenance Worker	Adult	Ingestion	Quant	Receptor could ingest surface soil from the site while conducting routine maintenance activities (i.e., mowing lawns).
						Dermal Absorption	Quant	Receptor could come into contact with surface soil from the site while conducting routine maintenance activities (i.e., mowing lawns).
				Commerical/Industrial Worker	Adult	Ingestion	Quant	Receptor could ingest surface soil while working on site.
						Dermal Absorption	Quant	Receptor could contact surface soil while working on site.
				Construction Worker	Adult	Ingestion	Quant	Receptor could ingest surface soil from the site during construction activities.
						Dermal Absorption	Quant	Receptor could come into contact with surface soil from the site during construction activities.
				Resident	Child	Ingestion	Quant	Receptor could ingest surface soil while living on site.
						Dermal Absorption	Quant	Receptor could come into contact with surface soil while living on site.
					Adult	Ingestion	Quant	Receptor could ingest surface soil while living on site.
						Dermal Absorption	Quant	Receptor could come into contact with surface soil while living on site.
					Child/Adult	Ingestion	Quant	The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to surface soil. The non-cancer hazard evaluations are treated separately for child and adult resident.
						Dermal Absorption	Quant	
		Air	Ambient Air Above Surface Soil (Particulates and Vapors)	Maintenance Worker	Adult	Inhalation	Quant	Receptor could inhale particulates and vapors from ambient air above the surface soil while working on site.
				Commerical/Industrial Worker	Adult	Inhalation	Quant	Receptor could inhale particulates and vapors from ambient air above the surface soil while working on site.
				Construction Worker	Adult	Inhalation	Quant	Receptor could inhale particulates and vapors from ambient air above the surface soil while working on site.
				Resident	Child	Inhalation	Quant	Receptor could inhale particulates and vapors from ambient air above the surface soil while living on site.
					Adult	Inhalation	Quant	Receptor could inhale particulates and vapors from ambient air above the surface soil while living on site.
					Child/Adult	Inhalation	Quant	The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to surface soil. The non-cancer hazard evaluations are treated separately for child and adult resident.

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Future Cont.	Subsurface Soil Cont.	Air Cont.	Upward Migration of Vapors from Soil (Indoors)	Maintenance Worker	Adult	Inhalation	None	Receptor is assumed to be outdoors.
				Commercial/Industrial Worker	Adult	Inhalation	Quant	Receptor could inhale VOCs from soil via vapor intrusion into building.
				Construction Worker	Adult	Inhalation	None	Receptor is assumed to be outdoors.
				Resident	Adult	Inhalation	Quant	Receptor could inhale VOCs from soil via vapor intrusion into residence.
					Child	Inhalation	Quant	Receptor could inhale VOCs from soil via vapor intrusion into residence.
					Child/Adult	Inhalation	Quant	The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to subsurface soil. The non-cancer hazard evaluations are treated separately for child and adult resident.
	Groundwater [1]	Groundwater	Groundwater	Maintenance Worker	Adult	Ingestion	None	Receptor is not likely to ingest groundwater from the site during maintenance activities.
						Dermal Absorption	None	Receptor is not likely to contact groundwater from the site during maintenance activities.
				Commercial/Industrial Worker	Adult	Ingestion	Quant	Receptor could ingest groundwater used as a water supply.
						Dermal Absorption	Quant	Receptor could come into contact with groundwater used as a water supply for industrial process.
				Construction Worker	Adult	Ingestion	None	Due to the depth to groundwater (approximately 90-100 ft bgs), the receptor is not likely to ingest groundwater during excavation activities.
						Dermal Absorption	None	Due to the depth to groundwater (approximately 90-100 ft bgs), the receptor is not likely to contact groundwater during excavation activities.
				Resident	Adult	Ingestion	Quant	Receptor could ingest groundwater used as a water supply.
						Dermal Absorption	Quant	Receptor could come into contact with groundwater used as a water supply.
					Child	Ingestion	Quant	Receptor could ingest groundwater used as a water supply.
						Dermal Absorption	Quant	Receptor could come into contact with groundwater used as a water supply.
					Child/Adult	Ingestion	Quant	The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to groundwater. The non-cancer hazard evaluations are treated separately for child and adult resident.
						Dermal Absorption	Quant	
		Air	Upward Migration of Vapors from Groundwater (Outdoors)	Maintenance Worker	Adult	Inhalation	None	Receptor is not likely to inhale vapors that migrated upward from groundwater to ambient air in any significant quantities.
				Commercial/Industrial Worker	Adult	Inhalation	None	Receptor is not likely to inhale vapors that migrated upward from groundwater to ambient air in any significant quantities.
				Construction Worker	Adult	Inhalation	Quant	Receptor could inhale vapors that migrated upward from groundwater to during excavation activities.
				Resident	Adult	Inhalation	None	Receptor is not likely to inhale vapors that migrated upward from groundwater to ambient air in any significant quantities.
					Child	Inhalation	None	Receptor is not likely to inhale vapors that migrated upward from groundwater to ambient air in any significant quantities.
					Child/Adult	Inhalation	None	The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to groundwater. The non-cancer hazard evaluations are treated separately for child and adult resident.[2]
			Upward Migration of Vapors from Groundwater (Indoors)	Maintenance Worker	Adult	Inhalation	None	Receptor is assumed to be outdoors.
				Commercial/Industrial Worker	Adult	Inhalation	Quant	Receptor could inhale VOCs from groundwater via vapor intrusion into building.
				Construction Worker	Adult	Inhalation	None	Receptor is assumed to be outdoors.
				Resident	Adult	Inhalation	Quant	Receptor could inhale VOCs from groundwater via vapor intrusion into residence.
					Child	Inhalation	Quant	Receptor could inhale VOCs from groundwater via vapor intrusion into residence.

Table E.1-1
Selection of Exposure Pathways - SWMU 40
SWMUs 40 and 71 RFI/CMS Report
Radford Army Ammunition Plant, Radford, Virginia

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Future Cont.	Groundwater Cont.	Air Cont.	Upward Migration of Vapors from Groundwater (Indoors) Cont.	Resident Cont.	Child/Adult	Inhalation	Quant	The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to groundwater. The non-cancer hazard evaluations are treated separately for child and adult resident.[2]
			Vapors while Showering	Maintenance Worker	Adult	Inhalation	None	Receptor is assumed not to shower on-site.
				Commercial/Industrial Worker	Adult	Inhalation	None	Receptor is assumed not to shower on-site.
				Construction Worker	Adult	Inhalation	None	Receptor is assumed not to shower on-site.
				Resident	Adult	Inhalation	Quant	Receptor could inhale vapors from groundwater while showering.
					Child	Inhalation	None	Receptor is assumed not to shower.
					Child/Adult	Inhalation	Quant	The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to groundwater. Since the shower scenario applies only to the adult resident, the lifetime resident exposure will be equivalent to that of the adult resident.[2]

Notes:
[1] Groundwater from the surface aquifer is not currently used at the sites for potable or non-potable water supply.

Notes:

COPC = Chemical of Potential Concern
CAS = Chemical Abstracts Service
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
PAH = Polynuclear Aromatic Hydrocarbon
TIC = Tentatively Identified Compound
mg/kg = Milligram Per Kilogram
RDA = Recommended Daily Allowance Based Screening Level
ARAR = Applicable, Relevant, and Appropriate Requirement
VDEQ = Virginia Department of Environmental Quality

TBC = To-Be-Considered
RBC = USEPA Region III Risk-Based Concentration
(RBC) values from the October 11, 2007,
RBC Table and October 11, 2007, Alternate RBC Table
Adjusted RBCs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
C/N = Carcinogenic/Noncarcinogenic per EPA RBC Table (October 2007)

ARES = Above Residential RBC
ARES/IND = Above Residential RBC/Industrial RBC
BSL = Below Residential/Industrial RBC Screening Levels
NSV = No Screening Value Available

[1] = Chromium VI RBC value was used
[2] = Lead criteria are Action Levels; see USEPA Region III guidance
[3] = Mercuric chloride soil RBC value used
[4] = Chlordane RBC value was used
[5] = Endosulfan RBC value was used
[6] = Endrin RBC value was used
[7] = Noncarcinogenic Residential RBC value for Aroclor 1254 was used for screening
[8] = Pyrene RBC value was used
[9] = See Table 6-3 for 2,3,7,8-TCDD TEQ Calculations
[10] = VDEQ TPH Screening Level used

Notes:

COPC = Chemical of Potential Concern
CAS = Chemical Abstracts Service
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
PAH = Polynuclear Aromatic Hydrocarbon
TIC = Tentatively Identified Compound
mg/kg = Milligram Per Kilogram
RDA = Recommended Daily Allowance Based Screening Level
ARAR = Applicable, Relevant, and Appropriate Requirement
TBC = To-Be-Considered

[1] = Chromium VI RBC value was used
[2] = Lead criteria are Action Levels; see USEPA Region III guidance
[3] = Mercuric chloride soil RBC value used
[4] = Chlordane RBC value was used
[5] = Endosulfan RBC value was used
[6] = Endrin RBC value was used
[7] = Noncarcinogenic Industrial RBC value for Aroclor 1016 was used for screening
[8] = Noncarcinogenic Residential RBC value for Aroclor 1254 was used for screening
[9] = 3-Methylphenol RBC value was used
[10] = Pyrene RBC value was used
[11] = See Table 6-3 for 2,3,7,8-TCDD TEQ Calculations
[12] = VDEQ TPH Screening Level used

RBC = USEPA Region III Risk-Based Concentration (RBC) values from the October 11, 2007, RBC Table and October 11, 2007, Alternate RBC Table
Adjusted RBCs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
C/N = Carcinogenic/Noncarcinogenic per EPA RBC Table (October 2007)

ARES = Above Residential RBC
ARES/IND = Above Residential RBC/Industrial RBC
ASL = Above Screening Level
BSL = Below Residential/Industrial RBC Screening Levels
NSV = No Screening Value Available

Notes:

CAS = Chemical Abstracts Service
mg/kg = Milligram Per Kilogram
ug/kg = Microgram Per Kilogram
pg/g = Picogram Per Gram
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
SVOC = Semi-volatile Organic Compound
PAH = Polynuclear Aromatic Hydrocarbon
MDL = Method Detection Limit
RBC = USEPA Region III Risk-Based Concentration (RBC) values from the October 11, 2007, RBC Table and October 11, 2007, Alternate RBC Table
Adjusted RBCs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
R-RBC = Residential RBC
SL = Screening Level

Y = MDL exceeds screening level
N = MDL does not exceed screening level
NS = No screening level available

[1] = Mercuric chloride soil RBC value used
[2] = Chlordane RBC value was used
[3] = Alpha-BHC RBC value was used
[4] = Endosulfan RBC value was used
[5] = Endrin RBC value was used
[6] = Noncarcinogenic Residential RBC value for Aroclor 1254 was used for screening
[7] = Noncarcinogenic RBC value for 2,4,6-Trichlorophenol was used
[8] = Noncarcinogenic RBC value for Hexachlorobutadiene was used
[9] = Noncarcinogenic RBC value for Hexachloroethane was used
[10] = Pyrene RBC value was used
[11] = Noncarcinogenic Residential and Industrial RBC values for 2,4,6-Trinitrotoluene were used for screening
[12] = Noncarcinogenic RBC value for 4-Nitrotoluene was used

Notes:

CAS = Chemical Abstracts Service
µg/L = Microgram Per Liter
TAL = Target Analyte List
TCL = Target Compound List
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
RBC = USEPA Region III Risk-Based Concentration (RBC) values from the October 11, 2007, RBC Table and October 11, 2007, Alternate RBC Table
ARAR = Applicable, Relevant, and Appropriate Requirement
TBC = To-Be-Considered

C = Carcinogenic per EPA RBC Table (October 2007)
N = Noncarcinogenic per EPA RBC Table (October 2007)
[1] = RBC for Chromium VI used for sceening
[2] = USEPA Drinking Water Action Level used for screening
[3] = RBC for Methylmercury used for screeening
MCL = Maximum Contaminant Level
BSL = Below Tap Water RBC/MCL
DUP AVG = results for duplicate samples averaged
ARBC = Above Tap Water RBC

Notes:

CAS = Chemical Abstracts Service
ug/L = Microgram per liter
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
SVOC = Semi-volatile Organic Compound
PAH = Polynuclear Aromatic Hydrocarbon
PETN = Pentaerythritol Tetranitrate
MDL = Method Detection Limit
RBC = USEPA Region III Risk-Based Concentration (RBC) values from the October 11, 2007, RBC Table and October 11, 2007, Alternate RBC Table
Adjusted RBCs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens

Y = MDL exceeds screening level
N = MDL does not exceed screening level
NS = No screening level available

[1] = Lead Action Level used for screening
[2] = Tap Water RBC for methylmercury used for screening
[3] = Noncarcinogenic Tap Water RBC value for Aroclor 1016 used for screening
[4] = Noncarcinogenic Tap Water RBC value for 2,4,6-Trichlorophenol used for screening
[5] = Tap Water RBC value for pyrene used for screening
[6] = Noncarcinogenic Tap Water RBC value for Hexachloroethane used for screening
[7] = Noncarcinogenic Tap Water RBC values for 2,4,6-Trinitrotoluene used for screening

Table E.1-3.1
EXPOSURE POINT CONCENTRATION SUMMARY
REASONABLE MAXIMUM EXPOSURE
Exposure to Contaminants in SWMU 40 Surface Soil

Notes:
FOD = frequency of detection
UCL = Upper Confidence Limit
mg/kg = Milligram Per Kilogram
* Due to the low frequency of detection, a mean and UCL were not calculated.
** Due to the sample size (2 samples), a mean and UCL were not calculated.

Table E.1-3.2
EXPOSURE POINT CONCENTRATION SUMMARY
REASONABLE MAXIMUM EXPOSURE
Exposure to Contaminants in SWMU 40 Total Soil
SWMUs 40 and 71 RFI/CMS Report
Radford Army Ammunition Plant, Radford, Virginia

Scenario Timeframe: Future
Medium: Total Soil
Exposure Medium: Total Soil

Exposure Point	Chemical of Potential Concern	Units	Arithmetic Mean of Detects	UCL	Maximum Concentration	Exposure Point Concentration			
						Value	Units	Statistic	Rationale
Total Soil	Aluminum	mg/kg	18,223	24,031	47,500	24,031	mg/kg	95% Chebyshev (Mean, Sd) UCL	ProUCL 4.0
	Antimony	mg/kg	1.006	1.129	6.1	1.13	mg/kg	95% KM (BCA) UCL	ProUCL 4.0
	Arsenic	mg/kg	10.72	20.57	74.6	20.57	mg/kg	95% KM (Chebyshev) UCL	ProUCL 4.0

Notes:

(1) Best professional judgement. Based on site maintenance conducted 1 day/week with 2 weeks/year vacation.
(2) PEFs provided on Table E.1-4.4
(3) VFs provided on Table E.1-4.3
(4) Chemical Concentration in Air for Indoor Vapors calculated using Johnson and Ettinger Model. See Table E.1-4.5
(5) The inhalation rate is calculated using a daily long term rate of 20 m^3/day (USEPA, 1991) divided by 24 hours to derive hourly inhalation rate of 0.83 m^3/hour.
(6) The inhalation rate is calculated using a daily long term rate of 12 m^3/day (USEPA, 2003) divided by 24 hours to derive hourly inhalation rate of 0.5 m^3/hour.

				AT-N	Averaging Time (Non-Cancer)	2,190	days	USEPA, 1991	
				BW	Body Weight	15	kg	USEPA, 1991	
				CA	Chemical Concentration in Indoor Air	calculated	mg/m^3	(3)	CDI (mg/kg-day) = $\frac{CA \times IR \times EF \times ED \times ET \times FI}{BW \times AT}$
				ED	Exposure Duration	6	years	USEPA, 1991	
				EF	Exposure Frequency	350	days/year	USEPA, 1991	
				ET	Exposure Time	18	hr/day	USEPA, 1997	
				IR	Inhalation Rate	0.5	m^3/hr	(7)	
				FI	Fraction of Exposure, Air	1	unitless	(2)	

Notes:

(1) See Table E.1-4.9 for trench air calculations.

(2) Best Professional Judgement. Based on 100% inhalation fraction.

(3) Chemical Concentration in Air for Indoor Vapors calculated using Johnson and Ettinger Model (See Table E.1-4.7).

(4) The inhalation rate is calculated using a daily long term rate of 20 m^3/day (USEPA, 1991) divided by 24 hours to derive hourly inhalation rate of 0.83 m^3/hour.

(5) Chemical Concentration in Air for Vapors while showering with groundwater calculated using Foster and Chrostowski Inhalation Model (See Table E.1-4.8).

(6) ET calculated using ET=(Ds+((exp(-Ra*t))/Ra - ((exp(Ra(Ds-t))/Ra)))*1hr/60min

Ds (shower time) =	30	min
t (total time in shower room) =	60	min
Ra (air exchange rate) =	0.01667	per min
ET=	0.261	hour/day

(7) The inhalation rate is calculated using a daily long term rate of 12 m^3/day (USEPA, 2003) divided by 24 hours to derive hourly inhalation rate of 0.5 m^3/hour.

Notes:
CAS = Chemical Abstract Service
ABS_d = Dermal Absorption Fraction
VF = Volatilization Factor
D_a = Apparent Diffusivity
m^3/kg = cubic meters per kilogram
cm2/s = centimeter squared per second

*ABS_d values are taken from Exhibit 3-4, Risk Assessment Guidance for Superfund (RAGS), Volume I, Human Health Evaluation and Manual, Part E; Supplemental Guidance for Dermal Risk Assessment, July 2004, and Region III Technical Guidance, Assessing Dermal Exposure in Soil, December 1995.

Table E.1-4.3.RME
Dermal Absorption Fractions and Volatilization Factors for Soil - SWMU 40
SWMUs 40 and 71 RFI/CMS Report
Radford Army Ammunition Plant, Radford, Virginia

Notes continued:

D_a values calculated using the following equation and values from the Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites. OSWER 9355.4-24. USEPA, 2002.

Equation 4-8 from USEPA, 2002:

$D_a = [((\Theta_a^{10/3} \times Di \times H) + (\Theta_w^{10/3} \times D_w))/n^2]/[((\rho_b \times K_d) + \Theta_w + (\Theta_a \times H)]$

Θ_a (L_{air}/L_{soil}) =	0.28	default
Θ_w (L_{water}/L_{soil}) =	0.15	default
D_i(cm2/sec) =	varies	
D_w(cm2/sec) =	varies	
H(unitless) =	varies	
n (L_{Pore}/L_{soil}) =	0.43	default
ρ_b (g/cm^3) =	1.50	default
K_d (cm^3/g) =	varies	
K_{oc} (cm^3/g) =	varies	
foc (g/g) =	0.011	

VF (soil only) values for commercial/industrial worker, adult resident, and child resident, and adolescent tresspasser calculated using the following equations and values from the Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites. OSWER 9355.4-24. USEPA, 2002.

Equation 4-8 from USEPA, 2002:

$VF = Q/C_{vol} * (3.14 * D_A * T)^{1/2} * CF/(2 * \rho_b * D_a)$

Q/C_{vol} (g/m2-s)/kg/m3) =	45.57	calculated value
D_A (cm^2/sec) =	varies	chemical specific (see above)
T (sec) =	varies	receptor specific exposure interval (T= ED(yrs)*365 days/year*24 hours/day*60 min/hour*60sec/min)
		(Maintenance Worker=7.88E+08 sec, Commercial/Industrial Worker=7.88E+08 sec, Adult Resident=7.56E+08, and Child Resident=1.89E+08)
CF (m^2/cm^2) =	1.00E-04	default
ρ_b (g/cm^3)	1.5	default

Exhibit D-3 from USEPA, 2002:

$Q/C_{vol} = A * e^{((\ln A_{site} - B)^2/C)}$ =

	45.57	
A =	9.9253	Huntington value
B =	18.6636	Huntington value
C =	211.8862	Huntington value
A_{site} (acres)=	2	contaminated site area

VF (soil only) values for construction worker were calculated using the following equations and values from the Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites. OSWER 9355.4-24. USEPA, 2002.

Equation 5-14 from USEPA 2002:

$VF = Q/C_{sa} * 1/F_D * (3.14 * D_A * T)^{1/2} * CF/(2 * \rho_b * D_A)$

Q/C_{sa} (g/m^2-s)/kg/m^3) =	11.06	calculated value
F_D (unitless) =	0.185	default
D_A (cm^2/sec) =	varies	chemical specific (see above)
T (sec) =	3.15E+07	receptor specific exposure interval (T= ED(yrs)*365 days/year*24 hours/day*60 min/hour*60sec/min)
CF (m^2/cm^2) =	1.00E-04	default
ρ_b (kg/L) =	1.5	default

Equation 5-15 from USEPA, 2002:

$Q/C_{sa} = A * e^{((\ln A_c - B)^2/C)}$ =

	11.06	
A=	2.4538	default
B =	17.566	default
C =	189.0426	default
A_c (acres)=	2	contaminated site area

Table E.1-4.4.RME
PEF Calculations - SWMU 40
SWMUs 40 and 71 RFI/CMS Report
Radford Army Ammunition Plant, Radford, Virginia

Commercial/Industrial Worker

Equation 4-5 from Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites. OSWER 9355.4-24. USEPA, 2002.

$$PEF = Q / C_{wind} \cdot \frac{3{,}600 s/h}{0.036 \cdot (1-V) \cdot (U_m / U_t)\text{^}3 \cdot F(x)}$$

Parameter	Value	
PEF	6.61E+08	
Q/C_{wind}	45.57	calculated below
V	0.5	default
U_m	4.69	default
U_t	11.32	default
F(x)	0.194	default

PEF = particulate emission factor (m^3/kg)
s/h = seconds per hour
Q/Cwind = Inverse of the ratio of the geometric mean air concentration to the emission flux at the center of a square source (g/m^3-s per kg/m^3)
V = fraction of vegatative cover (unitless)
U_m = mean annual windspeed (m/s)
U_t = equivalent threshold value of windspeed at 7m (m/s)
F(x) = function dependent on U_m/U_t derived using Cowherd et al. (1985)
Site Area = 2

Q/C_{wind} calculated in accordance with Exhibit D-2 from USEPA, 2002 using A, B, and C values for Huntington, WV:
$Q/C_{wind} = A*e\text{^}((\ln A_{site} - B)^2/C))$

Q/C_{wind}=	45.57	
A =	9.9253	unitless
B =	18.6636	unitless
C =	211.8862	unitless
A_{site}=	2	acres

Table E.1-4.4.RME
PEF Calculations - SWMU 40
SWMUs 40 and 71 RFI/CMS Report
Radford Army Ammunition Plant, Radford, Virginia

Construction Worker

Equation 5-5 from Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites. OSWER 9355.4-24. USEPA, 2002.

$$PEF_{sc} = Q / C_{sr} \cdot \frac{1}{F_D} \cdot \left[\frac{T \cdot A_R}{556 \cdot (W/3)^{0.4} \cdot \frac{(365\ d/yr - p)}{365\ d/yr} \cdot \sum VKT} \right]$$

Parameter	Value	
PEF_{sc}	1.17E+06	
Q/C_{sr}	18.44	calculated
F_D	0.185	default
T (sec)	7,488,000	assumed-see below
A_R (m^2)	548	calculated
W (tons)	8	assumed-see below
p (days/yr)	140	determined-see below
sumVKT (km)	690	assumed-see below

PEF_{sr} = subchronic road particulate emission factor (m^3/kg)
Q/C_{sr} = Inverse of the ratio of the 1-h geometric mean air concentration to the emission flux along a straight road segment bisecting a square site (g/m2-s per kg/m3)
F_D = dispersion correction factor (unitless)
T = total time over which construction occurs-total time period assumed to be 6 months (52wks x 5days per week x 8 hours per day x 3,600 s per hour)
A_R = surface area of contaminated road segment (m^2)
L_R = length of road segment (assumed to equal to (2 acres*43,560 ft^2/acre)$^{1/2}$)
W_R = width of road segment (assumed to be 20 ft)
$A_R = L_R \times W_R \times 0.092903 m^2/ft^2$
A_R= 548 m^2
W = mean vehicle weight assumed to be 8 tons ([(20 cars * 2 tons/car)+(10 trucks*20 tons/truck)]/30 vehicles)
p = number of days with at least 0.01 inches of precipitation (from Exhibit 5-2 140 days/year)
sumVKT = sum of fleet vehicle kilometers traveled during the exposure duration (km)
(30 of vehicles x 0.0885 km/day x 52wks x 5 days/wk)

Q/C_{sr} calculated in accordance with Equation 5-6:
using A, B, and C default values:
$Q/C_{sr} = A*e^{((\ln A_s - B)^2/C)}$

Q/C_{sr}=	18.44	g/m^2-s per kg/m^3
A =	12.9351	unitless
B =	5.7383	unitless
C =	71.7711	unitless
A_s =	2	acres

* Compounds are carcinogens that act via a mutagenic mode of action; therefore, carcinogenic risk for these compounds were calculated in accordance with "Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens" (USEPA 2005) and example calculations from "Derivation of RBCs for Carcinogens that Act Via a Mutagenic Mode of Action and Incorporate Default ADAFS" (USEPA 2006, Appendix E.4).
(1) Receptor assessed using the Johnson and Ettinger Model (see Table E.1-4.7)
(2) Receptor assessed using shower model from Foster and Chrostowski (1989) (See Table E.1-4.8)

* Compounds are carcinogens that act via a mutagenic mode of action; therefore, carcinogenic risk for these compounds were calculated in accordance with "Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens" (USEPA 2005) and example calculations from "Derivation of RBCs for Carcinogens that Act Via a Mutagenic Mode of Action and Incorporate Default ADAFS" (USEPA 2006, Appendix E.4).
(1) Receptor assessed using the Johnson and Ettinger Model (see Table 4.7)

* Compounds are carcinogens that act via a mutagenic mode of action; therefore, carcinogenic risk for these compounds were calculated in accordance with "Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens" (USEPA 2005) and example calculations from "Derivation of RBCs for Carcinogens that Act Via a Mutagenic Mode of Action and Incorporate Default ADAFS" (USEPA 2006, Appendix E.4).

(1) Receptor assessed using the Johnson and Ettinger Model (see Table 4.7)

(2) Receptor assessed using shower model from Foster and Chrostowski (1989) (See Table 4.8)

LEAD IEUBK MODEL RESULTS

THIS PAGE LEFT INTENTIONALLY BLANK

LEAD MODEL FOR WINDOWS Version 1.0

==========
Model Version: 1.0 Build 263
User Name: Tina DeVine
Date: 11/26/2007
Site Name: SWMU 40-RFAAP
Operable Unit: SWMU 40
Run Mode: Site Risk Assessment

Water Data
Maximum detected concentration of lead in GW
==========
The time step used in this model run: 1 - Every 4 Hours (6 times a day).

****** Air ******

Indoor Air Pb Concentration: 30.000 percent of outdoor.
Other Air Parameters:

Age	Time Outdoors (hours)	Ventilation Rate (m^3/day)	Lung Absorption (%)	Outdoor Air Pb Conc (ug Pb/m^3)
.5-1	1.000	2.000	32.000	0.100
1-2	2.000	3.000	32.000	0.100
2-3	3.000	5.000	32.000	0.100
3-4	4.000	5.000	32.000	0.100
4-5	4.000	5.000	32.000	0.100
5-6	4.000	7.000	32.000	0.100
6-7	4.000	7.000	32.000	0.100

****** Diet ******

Age	Diet Intake(ug/day)
.5-1	5.530
1-2	5.780
2-3	6.490
3-4	6.240
4-5	6.010
5-6	6.340
6-7	7.000

****** Drinking Water ******

Water Consumption:

Age	Water (L/day)
.5-1	0.200
1-2	0.500
2-3	0.520
3-4	0.530
4-5	0.550
5-6	0.580
6-7	0.590

Drinking Water Concentration: 0.510 ug Pb/L

****** Soil & Dust ******

Multiple Source Analysis Used
Average multiple source concentration: 48.360 ug/g

Mass fraction of outdoor soil to indoor dust conversion factor: 0.700
Outdoor airborne lead to indoor household dust lead concentration: 100.000
Use alternate indoor dust Pb sources? No

Age	Soil (ug Pb/g)	House Dust (ug Pb/g)
.5-1	54.800	48.360
1-2	54.800	48.360
2-3	54.800	48.360
3-4	54.800	48.360
4-5	54.800	48.360
5-6	54.800	48.360
6-7	54.800	48.360

****** Alternate Intake ******

Age	Alternate (ug Pb/day)
.5-1	0.000
1-2	0.000
2-3	0.000
3-4	0.000
4-5	0.000
5-6	0.000
6-7	0.000

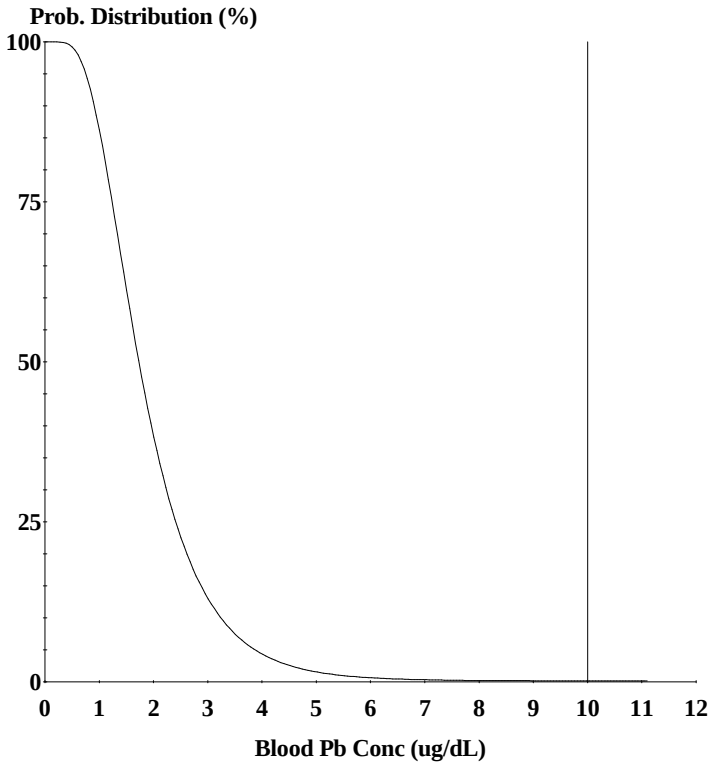
****** Maternal Contribution: Infant Model ******

Maternal Blood Concentration: 2.500 ug Pb/dL

****
CALCULATED BLOOD LEAD AND LEAD UPTAKES:
****

Year	Air (ug/day)	Diet (ug/day)	Alternate (ug/day)	Water (ug/day)
.5-1	0.021	2.644	0.000	0.049
1-2	0.034	2.770	0.000	0.122
2-3	0.062	3.121	0.000	0.128
3-4	0.067	3.020	0.000	0.131
4-5	0.067	2.931	0.000	0.137
5-6	0.093	3.100	0.000	0.145
6-7	0.093	3.425	0.000	0.147

Year	Soil+Dust (ug/day)	Total (ug/day)	Blood (ug/dL)
.5-1	1.250	3.964	2.2
1-2	1.989	4.916	2.1
2-3	1.997	5.308	2.0
3-4	2.009	5.227	1.9
4-5	1.500	4.635	1.6
5-6	1.354	4.692	1.5
6-7	1.279	4.945	1.4



Cutoff = 10.000 ug/dl
Geo Mean = 1.815
GSD = 1.600
% Above = 0.014

Age Range = 0 to 84 months
Time Step = Every 4 Hours
Run Mode = Site Risk Assessment

IR_S	X		Soil ingestion rate (including soil-derived indoor dust)	g/day	0.100	0.100	--	--
IR_{S+D}		X	Total ingestion rate of outdoor soil and indoor dust	g/day	--	--	0.100	0.100
W_S		X	Weighting factor; fraction of IR_{S+D} ingested as outdoor soil	--	--	--	1.0	1.0
K_{SD}		X	Mass fraction of soil in dust	--	--	--	0.7	0.7
$AF_{S,D}$	X	X	Absorption fraction (same for soil and dust)	--	0.12	0.12	0.12	0.12
$EF_{S,D}$	X	X	Exposure frequency (same for soil and dust)	days/yr	219	219	219	219
$AT_{S,D}$	X	X	Averaging time (same for soil and dust)	days/yr	365	365	365	365
PbB_{adult}	**PbB of adult worker, geometric mean**			**ug/dL**	**1.6**	**1.8**	**1.6**	**1.8**
$PbB_{fetal,\ 0.95}$	**95th percentile PbB among fetuses of adult workers**			**ug/dL**	**4.8**	**6.3**	**4.8**	**6.3**
PbB_t	**Target PbB level of concern (e.g., 10 ug/dL)**			**ug/dL**	**10.0**	**10.0**	**10.0**	**10.0**
$P(PbB_{fetal} > PbB_t)$	**Probability that fetal PbB > PbB_t, assuming lognormal distribution**			**%**	**0.4%**	**1.4%**	**0.4%**	**1.4%**

[1] Equation 1 does not apportion exposure between soil and dust ingestion (excludes W_S, K_{SD}).
When $IR_S = IR_{S+D}$ and $W_S = 1.0$, the equations yield the same $PbB_{fetal,0.95}$.

***Equation 1, based on Eq. 1, 2 in USEPA (1996).**

PbB_{adult} =	$(PbS*BKSF*IR_{S+D}*AF_{S,D}*EF_S/AT_{S,D}) + PbB_0$
$PbB_{fetal,\ 0.95}$ =	$PbB_{adult} * (GSD_i^{1.645} * R)$

****Equation 2, alternate approach based on Eq. 1, 2, and A-19 in USEPA (1996).**

PbB_{adult} =	$PbS*BKSF*([(IR_{S+D})*AF_S*EF_S*W_S]+[K_{SD}*(IR_{S+D})*(1-W_S)*AF_D*EF_D])/365+PbB_0$
$PbB_{fetal,\ 0.95}$ =	$PbB_{adult} * (GSD_i^{1.645} * R)$

Table E.2-1
Selection of Exposure Pathways - SWMU 71
SWMUs 40 and 71 RFI/CMS Report
Radford Army Ammunition Plant, Radford, Virginia

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Current/Future	Surface Soil	Surface Soil	Surface Soil	Maintenance Worker	Adult	Ingestion	Quant	Receptor could ingest surface soil from the site while conducting routine maintenance activities (i.e., mowing lawns).
						Dermal Absorption	Quant	Receptor could come into contact with surface soil from the site while conducting routine maintenance activities (i.e., mowing lawns).
		Air	Ambient Air Above Surface Soil (Particulates and Vapors)	Maintenance Worker	Adult	Inhalation	Quant	Receptor could inhale particulates and vapors from ambient air above the surface soil.
	Subsurface Soil	Subsurface Soil	Subsurface Soil	Maintenance Worker	Adult	Ingestion	None	Receptor is not likely to ingest subsurface soil from the site since maintenance does not include excavation.
						Dermal Absorption	None	Receptor is not likely to come in contact with subsurface soil from the site since maintenance does not include excavation.
		Air	Ambient Air Above Subsurface Soil (Particulates and Vapors)	Maintenance Worker	Adult	Inhalation	None	Receptor is not likely to inhale particulates and vapors from ambient air above the subsurface soil since maintenance activities do not include excavation.
	Groundwater [1]	Groundwater	Groundwater	Maintenance Worker	Adult	Ingestion	None	Receptor is not likely to ingest groundwater from the site during maintenance activities.
						Dermal Absorption	None	Receptor is not likely to contact groundwater from the site during maintenance activities.
		Air	Upward Migration of Vapors from Groundwater (Outdoors)	Maintenance Worker	Adult	Inhalation	None	Receptor is not likely to inhale vapors that migrated upward from groundwater to ambient air in any significant quantities.
			Upward Migration of Vapors from Groundwater (Indoors)	Maintenance Worker	Adult	Inhalation	None	Receptor is assumed to be outdoors.
			Vapors while Showering	Maintenance Worker	Adult	Inhalation	None	Receptor is assumed not to shower on-site.
Future	Surface Soil	Surface Soil	Surface Soil	Maintenance Worker	Adult	Ingestion	Quant	Receptor could ingest surface soil from the site while conducting routine maintenance activities (i.e., mowing lawns).
						Dermal Absorption	Quant	Receptor could come into contact with surface soil from the site while conducting routine maintenance activities (i.e., mowing lawns).
				Commerical/Industrial Worker	Adult	Ingestion	Quant	Receptor could ingest surface soil while working on site.
						Dermal Absorption	Quant	Receptor could contact surface soil while working on site.
				Construction Worker	Adult	Ingestion	Quant	Receptor could ingest surface soil from the site during construction activities.
						Dermal Absorption	Quant	Receptor could come into contact with surface soil from the site during construction activities.
				Resident	Child	Ingestion	Quant	Receptor could ingest surface soil while living on site.
						Dermal Absorption	Quant	Receptor could come into contact with surface soil while living on site.
					Adult	Ingestion	Quant	Receptor could ingest surface soil while living on site.
						Dermal Absorption	Quant	Receptor could come into contact with surface soil while living on site.
					Child/Adult	Ingestion	Quant	The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to surface soil. The non-cancer hazard evaluations are treated separately for child and adult resident.
						Dermal Absorption	Quant	
		Air	Ambient Air Above Surface Soil (Particulates and Vapors)	Maintenance Worker	Adult	Inhalation	Quant	Receptor could inhale particulates and vapors from ambient air above the surface soil while working on site.
				Commerical/Industrial Worker	Adult	Inhalation	Quant	Receptor could inhale particulates and vapors from ambient air above the surface soil while working on site.
				Construction Worker	Adult	Inhalation	Quant	Receptor could inhale particulates and vapors from ambient air above the surface soil while working on site.
				Resident	Child	Inhalation	Quant	Receptor could inhale particulates and vapors from ambient air above the surface soil while living on site.
					Adult	Inhalation	Quant	Receptor could inhale particulates and vapors from ambient air above the surface soil while living on site.
					Child/Adult	Inhalation	Quant	The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to surface soil. The non-cancer hazard evaluations are treated separately for child and adult resident.

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Future Cont.	Subsurface Soil Cont.	Air Cont.	Upward Migration of Vapors from Soil (Indoors)	Maintenance Worker	Adult	Inhalation	None	Receptor is assumed to be outdoors.
				Commercial/Industrial Worker	Adult	Inhalation	Quant	Receptor could inhale VOCs from soil via vapor intrusion into building.
				Construction Worker	Adult	Inhalation	None	Receptor is assumed to be outdoors.
				Resident	Adult	Inhalation	Quant	Receptor could inhale VOCs from soil via vapor intrusion into residence.
					Child	Inhalation	Quant	Receptor could inhale VOCs from soil via vapor intrusion into residence.
					Child/Adult	Inhalation	Quant	The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to subsurface soil. The non-cancer hazard evaluations are treated separately for child and adult resident.
	Groundwater [1]	Groundwater	Groundwater	Maintenance Worker	Adult	Ingestion	None	Receptor is not likely to ingest groundwater from the site during maintenance activities.
						Dermal Absorption	None	Receptor is not likely to contact groundwater from the site during maintenance activities.
				Commercial/Industrial Worker	Adult	Ingestion	Quant	Receptor could ingest groundwater used as a water supply.
						Dermal Absorption	Quant	Receptor could come into contact with groundwater used as a water supply for industrial process.
				Construction Worker	Adult	Ingestion	None	Due to the depth to groundwater (approximately 90-100 ft bgs), the receptor is not likely to ingest groundwater during excavation activities.
						Dermal Absorption	None	Due to the depth to groundwater (approximately 90-100 ft bgs), the receptor is not likely to contact groundwater during excavation activities.
				Resident	Adult	Ingestion	Quant	Receptor could ingest groundwater used as a water supply.
						Dermal Absorption	Quant	Receptor could come into contact with groundwater used as a water supply.
					Child	Ingestion	Quant	Receptor could ingest groundwater used as a water supply.
						Dermal Absorption	Quant	Receptor could come into contact with groundwater used as a water supply.
					Child/Adult	Ingestion	Quant	The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to groundwater. The non-cancer hazard evaluations are treated separately for child and adult resident.
						Dermal Absorption	Quant	
		Air	Upward Migration of Vapors from Groundwater (Outdoors)	Maintenance Worker	Adult	Inhalation	None	Receptor is not likely to inhale vapors that migrated upward from groundwater to ambient air in any significant quantities.
				Commercial/Industrial Worker	Adult	Inhalation	None	Receptor is not likely to inhale vapors that migrated upward from groundwater to ambient air in any significant quantities.
				Construction Worker	Adult	Inhalation	Quant	Receptor could inhale vapors that migrated upward from groundwater to during excavation activities.
				Resident	Adult	Inhalation	None	Receptor is not likely to inhale vapors that migrated upward from groundwater to ambient air in any significant quantities.
					Child	Inhalation	None	Receptor is not likely to inhale vapors that migrated upward from groundwater to ambient air in any significant quantities.
					Child/Adult	Inhalation	None	The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to groundwater. The non-cancer hazard evaluations are treated separately for child and adult resident.[2]
			Upward Migration of Vapors from Groundwater (Indoors)	Maintenance Worker	Adult	Inhalation	None	Receptor is assumed to be outdoors.
				Commercial/Industrial Worker	Adult	Inhalation	Quant	Receptor could inhale VOCs from groundwater via vapor intrusion into building.
				Construction Worker	Adult	Inhalation	None	Receptor is assumed to be outdoors.
				Resident	Adult	Inhalation	Quant	Receptor could inhale VOCs from groundwater via vapor intrusion into residence.
					Child	Inhalation	Quant	Receptor could inhale VOCs from groundwater via vapor intrusion into residence.

Table E.2-1
Selection of Exposure Pathways - SWMU 71
SWMUs 40 and 71 RFI/CMS Report
Radford Army Ammunition Plant, Radford, Virginia

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Future Cont.	Groundwater Cont.	Air Cont.	Upward Migration of Vapors from Groundwater (Indoors) Cont.	Resident Cont.	Child/Adult	Inhalation	Quant	The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to groundwater. The non-cancer hazard evaluations are treated separately for child and adult resident.[2]
			Vapors while Showering	Maintenance Worker	Adult	Inhalation	None	Receptor is assumed not to shower on-site.
				Commercial/Industrial Worker	Adult	Inhalation	None	Receptor is assumed not to shower on-site.
				Construction Worker	Adult	Inhalation	None	Receptor is assumed not to shower on-site.
				Resident	Adult	Inhalation	Quant	Receptor could inhale vapors from groundwater while showering.
					Child	Inhalation	None	Receptor is assumed not to shower.
					Child/Adult	Inhalation	Quant	The cancer risk estimates for the adult resident (24 years) and child resident (6 years) are added together (30 years) to address lifetime exposure to groundwater. Since the shower scenario applies only to the adult resident, the lifetime resident exposure will be equivalent to that of the adult resident.[2]

Notes:

[1] Groundwater from the surface aquifer is not currently used at the sites for potable or non-potable water supply.

Table E.2-2.1
SWMU 71 COPC Determination - Surface Soil
SWMUs 40 and 71 RFI/CMS Report
Radford Army Ammunition Plant, Radford, Virginia

Notes:

COPC = Chemical of Potential Concern
CAS = Chemical Abstracts Service
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
PAH = Polynuclear Aromatic Hydrocarbon
TIC = Tentatively Identified Compound
mg/kg = Milligram Per Kilogram
ARAR = Applicable, Relevant, and Appropriate Requirement
TBC = To-Be-Considered
RDA = Recommended Daily Allowance Based Screening Level

RBC = USEPA Region III Risk-Based Concentration
(RBC) values from the October 11, 2007,
RBC Table and October 11, 2007, Alternate RBC Table
Adjusted RBCs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
C/N = Carcinogenic/Noncarcinogenic per EPA RBC Table (October 2007)
IND = Adjusted Industrial RBC
VDEQ = Virginia Department of Environmental Qualtiy Screening Level

ARES = Above Residential RBC
ARES/IND = Above Residential RBC/Industrial RBC
BSL = Below Residential/Industrial RBC Screening Levels
NSV = No Screening Value Available

[1] = Chromium VI RBC value was used
[2] = Lead criteria are Action Levels; see USEPA Region III guidance
[3] = Mercuric chloride soil RBC value used
[4] = Noncarcinogenic Residential RBC value for Aroclor 1254 was used for screening
[5] = Pyrene RBC value was used
[6] = See Table 6-3 for 2,3,7,8-TCDD TEQ Calculations
[7] = VDEQ TPH Screening Level used

Table E.2-2.2
SWMU 71 COPC Determination - Total Soil
SWMUs 40 and 71 RFI/CMS Report
Radford Army Ammunition Plant, Radford, Virginia

Notes:

COPC = Chemical of Potential Concern
CAS = Chemical Abstracts Service
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
PAH = Polynuclear Aromatic Hydrocarbon
TIC = Tentatively Identified Compound
mg/kg = Milligram Per Kilogram
RDA = Recommended Daily Allowance Based Screening Level
ARAR = Applicable, Relevant, and Appropriate Requirement
TBC = To-Be-Considered

RBC = USEPA Region III Risk-Based Concentration
(RBC) values from the October 11, 2007,
RBC Table and October 11, 2007, Alternate RBC Table
Adjusted RBCs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
C = Carcinogenic per EPA RBC Table (October 2007)
N = Noncarcinogenic per EPA RBC Table (October 2007)
IND = Adjusted Industrial RBC
VDEQ = Virginia Department of Environmental Qualtiy Screening Level

ARES = Above Residential RBC
***ARES/IND* =** Above Residential RBC/Industrial RBC
BSL = Below Residential/Industrial RBC Screening Levels
NSV = No Screening Value Available

[1] = Chromium VI RBC value was used
[2] = Lead criteria are Action Levels; see USEPA Region III guidance
[3] = Mercuric chloride soil RBC value used
[4] = Noncarcinogenic Industrial RBC value for Aroclor 1016 was used for screening
[5] = Noncarcinogenic Residential RBC value for Aroclor 1254 was used for screening
[6] = Pyrene RBC value was used
[7] = See Table 6-3 for 2,3,7,8-TCDD TEQ Calculations
[8] = VDEQ TPH Screening Level used

Table E.2-2.3
Non-detected Chemical MDL Screening for SWMU 71 - Total Soil
SWMUs 40 and 71 RFI/CMS Report
Radford Army Ammunition Plant, Radford, Virginia

Parameter Name	CAS #	Units	Number of Non-Detects	Number of Samples	Minimum MDL	Maximum MDL	Adjusted R-RBC	Maximum MDL Exceeds SL
Nitroglycerin								
Nitroglycerin	55-63-0	mg/kg	7	7	1	1	7.8E-01	**Y**

Notes:

CAS = Chemical Abstracts Service
mg/kg = Milligram Per Kilogram
ug/kg = Microgram Per Kilogram
pg/g = Picogram Per Gram
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
SVOC = Semi-volatile Organic Compound
PAH = Polynuclear Aromatic Hydrocarbon
MDL = Method Detection Limit
RBC = USEPA Region III Risk-Based Concentration (RBC) values from the October 11, 2007, RBC Table and October 11, 2007, Alternate RBC Table
Adjusted RBCs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
R-RBC = Residential RBC

Y = MDL exceeds screening level
N = MDL does not exceed screening level
NS = No screening level available
SL = Screening Level

[1] = Mercuric chloride soil RBC value used
[2] = Chlordane RBC value was used
[3] = Alpha-BHC RBC value was used
[4] = Endosulfan RBC value was used
[5] = Endrin RBC value was used
[6] = Noncarcinogenic Residential RBC value for Aroclor 1254 was used for screening
[7] = Noncarcinogenic RBC value for 2,4,6-Trichlorophenol was used
[8] = Noncarcinogenic RBC value for Hexachlorobutadiene was used
[9] = Noncarcinogenic RBC value for Hexachloroethane was used
[10] = Pyrene RBC value was used
[11] = Noncarcinogenic Residential and Industrial RBC values for 2,4,6-Trinitrotoluene were used for screening
[12] = Noncarcinogenic RBC value for 4-Nitrotoluene was used

Notes:

CAS = Chemical Abstracts Service
µg/L = Microgram Per Liter
TAL = Target Analyte List
TCL = Target Compound List
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
RBC = USEPA Region III Risk-Based Concentration (RBC) values from the October 11, 2007, RBC Table and October 11, 2007, Alternate RBC Table
ARAR = Applicable, Relevant, and Appropriate Requirement
TBC = To-Be-Considered

C = Carcinogenic per EPA RBC Table (October 2007)
N = Noncarcinogenic per EPA RBC Table (October 2007)
[1] = RBC for Chromium VI used for sceening
[2] = USEPA Drinking Water Action Level used for screening
[3] = RBC for Methylmercury used for screeening
MCL = Maximum Contaminant Level
BSL = Below Tap Water RBC/MCL
DUP AVG = results for duplicate samples averaged
ARBC = Above Tap Water RBC

Notes:

CAS = Chemical Abstracts Service
ug/L = Microgram per liter
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
SVOC = Semi-volatile Organic Compound
PAH = Polynuclear Aromatic Hydrocarbon
PETN = Pentaerythritol Tetranitrate
MDL = Method Detection Limit
RBC = USEPA Region III Risk-Based Concentration (RBC) values from the October 11, 2007, RBC Table and October 11, 2007, Alternate RBC Table
Adjusted RBCs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
[1] = Lead Action Level used for screening
[2] = Tap Water RBC for methylmercury used for screening
[3] = Noncarcinogenic Tap Water RBC value for Aroclor 1016 used for screening
[4] = Noncarcinogenic Tap Water RBC value for 2,4,6-Trichlorophenol used for screening
[5] = Tap Water RBC value for pyrene used for screening
[6] = Noncarcinogenic Tap Water RBC value for Hexachloroethane used for screening
[7] = Noncarcinogenic Tap Water RBC values for 2,4,6-Trinitrotoluene used for screening

Y = MDL exceeds screening level
N = MDL does not exceed screening level
NS = No screening level available

Table E.2-3.1

VF (soil only) values for commercial/industrial worker, adult resident, and child resident, and adolescent tresspasser calculated using the following equations and values from the Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites. OSWER 9355.4-24. USEPA, 2002.
Equation 4-8 from USEPA, 2002:

$VF = Q/C_{vol} * (3.14 * D_A * T)^{1/2} * CF/(2 * \rho_b * D_a)$

Q/C_{vol} (g/m2-s)/kg/m3) =	90.12	calculated value
D_A (cm^2/sec) =	varies	chemical specific (see above)
T (sec) =	varies	receptor specific exposure interval (T= ED(yrs)*365 days/year*24 hours/day*60 min/hour*60sec/min)
		(Maintenance Worker=7.88E+08 sec, Commercial/Industrial Worker=7.88E+08 sec, Adult Resident=7.56E+08, and Child Resident=1.89E+08)
CF (m^2/cm^2) =	1.00E-04	default
ρ_b (g/cm^3)	1.5	default

Exhibit D-3 from USEPA, 2002:

$Q/C_{vol} = A * e^{((\ln A_{site} - B)^2/C)}$ =

	90.12	
A =	9.9253	Huntington value
B =	18.6636	Huntington value
C =	211.8862	Huntington value
A_{site} (acres)=	0.052	contaminated site area

VF (soil only) values for construction worker were calculated using the following equations and values from the Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites. OSWER 9355.4-24. USEPA, 2002.
Equation 5-14 from USEPA 2002:

$VF = Q/C_{sa} * 1/F_D * (3.14 * D_A * T)^{1/2} * CF/(2 * \rho_b * D_A)$

Q/C_{sa} (g/m^2-s)/kg/m^3) =	22.77	calculated value
F_D (unitless) =	0.185	default
D_A (cm^2/sec) =	varies	chemical specific (see above)
T (sec) =	3.15E+07	receptor specific exposure interval (T= ED(yrs)*365 days/year*24 hours/day*60 min/hour*60sec/min)
CF (m^2/cm^2) =	1.00E-04	default
ρ_b (kg/L) =	1.5	default

Equation 5-15 from USEPA, 2002:

$Q/C_{sa} = A * e^{((\ln A_c - B)^2/C)}$ =

	22.77	
A=	2.4538	default
B =	17.566	default
C =	189.0426	default
A_c (acres)=	0.052	contaminated site area

Table E.2-4.4.RME
PEF Calculations - SWMU 71
SWMUs 40 and 71 RFI/CMS Report
Radford Army Ammunition Plant, Radford, Virginia

Commercial/Industrial Worker

Equation 4-5 from Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites. OSWER 9355.4-24. USEPA, 2002.

$$PEF = Q / C_{wind} \cdot \frac{3{,}600 s/h}{0.036 \cdot (1-V) \cdot (U_m / U_t)\text{^}3 \cdot F(x)}$$

Parameter	Value	
PEF	1.31E+09	
Q/C_{wind}	90.12	calculated below
V	0.5	default
U_m	4.69	default
U_t	11.32	default
F(x)	0.194	default

PEF = particulate emission factor (m^3/kg)
s/h = seconds per hour
Q/Cwind = Inverse of the ratio of the geometric mean air concentration to the emission flux at the center of a square source (g/m^3-s per kg/m^3)
V = fraction of vegatative cover (unitless)
U_m = mean annual windspeed (m/s)
U_t = equivalent threshold value of windspeed at 7m (m/s)
F(x) = function dependent on U_m/U_t derived using Cowherd et al. (1985)
Site Area = 0.052

Q/C_{wind} calculated in accordance with Exhibit D-2 from USEPA, 2002
using A, B, and C values for Huntington, WV:
$Q/C_{wind} = A*e\text{^}((\ln A_{site} - B)^2/C))$

Q/C_{wind}=	90.12	
A =	9.9253	unitless
B =	18.6636	unitless
C =	211.8862	unitless
A_{site}=	0.052	acres

Table E.2-4.4.RME
PEF Calculations - SWMU 71
SWMUs 40 and 71 RFI/CMS Report
Radford Army Ammunition Plant, Radford, Virginia

Construction Worker

Equation 5-5 from Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites. OSWER 9355.4-24. USEPA, 2002.

$$PEF_{sc} = Q / C_{sr} \cdot \frac{1}{F_D} \cdot \left[\frac{T \cdot A_R}{556 \cdot (W/3)^{\wedge} 0.4 \cdot \frac{(365\ d/yr - p)}{365\ d/yr} \cdot \sum VKT} \right]$$

Parameter	Value	
PEF_{sc}	2.36E+06	
Q/C_{sr}	37.09	calculated
F_D	0.185	default
T (sec)	7,488,000	assumed-see below
A_R (m^2)	88	calculated
W (tons)	8	assumed-see below
p (days/yr)	140	determined-see below
sumVKT (km)	111	assumed-see below

PEF_{sr} = subchronic road particulate emission factor (m^3/kg)
Q/C_{sr} = Inverse of the ratio of the 1-h geometric mean air concentration to the emission flux along a straight road segment bisecting a square site (g/m2-s per kg/m3)
F_D = dispersion correction factor (unitless)
T = total time over which construction occurs-total time period assumed to be 6 months
(52wks x 5days per week x 8 hours per day x 3,600 s per hour)
A_R = surface area of contaminated road segment (m^2)
L_R = length of road segment (assumed to equal to (0.052 acres*43,560 ft^2/acre)$^{1/2}$)
W_R = width of road segment (assumed to be 20 ft)
$A_R = L_R \times W_R \times 0.092903 m^2/ft^2$
A_R= 88 m^2
W = mean vehicle weight assumed to be 8 tons ([(20 cars * 2 tons/car)+(10 trucks*20 tons/truck)]/30 vehicles)
p = number of days with at least 0.01 inches of precipitation (from Exhibit 5-2 140 days/year)
sumVKT = sum of fleet vehicle kilometers traveled during the exposure duration (km)
(30 of vehicles x 0.00143 of km/day x 52wks x 5 days/wk)

Q/C_{sr} calculated in accordance with Equation 5-6:
using A, B, and C default values:
$Q/C_{sr} = A*e^{\wedge}((\ln A_s - B)^2/C))$

Q/C_{sr}=	37.09	g/m^2-s per kg/m^3
A =	12.9351	unitless
B =	5.7383	unitless
C =	71.7711	unitless
A_s =	0.052	acres

Notes:

CSF = Cancer Slope Factor
mg/(kg-d) = Milligrams Per Kilogram Day
IRIS = Integrated Risk Information System
HEAST = Health Effects Assessment Summary Tables
NA = Not Available
Cancer Guideline Description:
A = Human carcinogen
B1 = Probable human carcinogen - indicates that limited human data are available.
B2 = Probable human carcinogen - indicates sufficient evidence in animals and inadequate or no evidence in humans
C = Possible human carcinogen
D = Not classifiable as a human carcinogen

Source Date:
The hierarchy of toxicity values used is:
IRIS, PPRTVs (if available), Region III and VDEQ.
For IRIS values, the date of the IRIS search is provided.
For HEAST values, the date of the HEAST Table is provided.

(1) Oral absorption efficiency for dermal from Risk Assessment Guidance for Superfund (RAGS), Volume I: Human Health Evaluation Manual, Part E - Supplemental Guidance for Dermal Risk Assessment. Final. . EPA/540/R/99/005. 2004
(2) Chromium VI toxicity data used.

* Compounds are carcinogens that act via a mutagenic mode of action; therefore, carcinogenic risk for these compounds were calculated in accordance with "Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens" (USEPA 2005) and example calculations from "Derivation of RBCs for Carcinogens that Act Via a Mutagenic Mode of Action and Incorporate Default ADAFS" (USEPA 2006, Appendix E.4).
(1) Receptor assessed using the Johnson and Ettinger Model (see Table 4.7)
(2) Receptor assessed using shower model from Foster and Chrostowski (1989) (See Table 4.8)

DERIVATION OF RBCs FOR CARCINOGENS THAT ACT VIA A MUTAGENIC MODE OF ACTION AND INCORPORATE DEFAULT ADAFs – EXAMPLE CALCULATIONS (USEPA 2006)

THIS PAGE LEFT INTENTIONALLY BLANK

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION III
1650 Arch Street
Philadelphia, Pennsylvania 19103

SUBJECT: Derivation of RBCs for Carcinogens that Act Via a Mutagenic Mode of Action and Incorporate Default ADAFs

FROM: Jennifer Hubbard, Toxicologist
Technical Support Branch (3HS41)

TO: RBC Table Users

DATE: October 19, 2006
*corrected November 8, 2006**

Because of the special considerations for carcinogens that act via a mutagenic mode of action, this memo includes a demonstration of the assumptions behind the Region III RBCs for those chemicals that incorporate the default age-dependent adjustment factors (ADAFs). A sample calculation for each medium is provided below.

On March 29, 2005, EPA Administrator Stephen Johnson provided general direction on implementing EPA's 2005 Guidelines for Carcinogen Risk Assessment and Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens. This was followed by an announcement in the April 7, 2005 Federal Register, and by the release of additional guidance documents concerning the implementation of the new cancer guidelines.

The aspect of the new guidelines that most directly affects Region III RBCs is the use of ADAFs to adjust cancer risk for receptors whose exposure includes early life. For chemicals that EPA has determined to be carcinogenic via a mutagenic mode of action, special adjustments are applied in estimating cancer risks. Vinyl chloride has a chemical-specific adjustment, described in its IRIS file. The impact of vinyl chloride's adjustment on Region III RBCs was discussed in the May 6, 2001 memo, "Derivation of Vinyl Chloride RBCs," found at http://www.epa.gov/reg3hwmd/risk/human/info/vcrbc.pdf. For the other chemicals, where no chemical-specific ADAFs have been developed, default ADAFs are used: 10 for age 0-2, 3 for age 2-16, and no adjustment for ages 16 and up. These chemicals are now marked with an "m" on the Region III RBC Table.

One example for each medium is provided below. The exposure factors are consistent with the defaults used in the other RBCs.

**The original October 19 version of this memo contained a typographical error in Section 2A: "mg/L" was used instead of "ug/L" for the concentration term in three of the equations. The units have now been corrected.*

SAMPLE EQUATIONS - RBCs

1. Soil, Residential

Sample Chemical: Benzo[a]pyrene
PRG = 0.022 mg/kg

Age 0-2

$$\frac{0.022 \text{ mg/kg} \times 200 \text{ mg/day} \times 350 \text{ days/yr} \times 2 \text{ yrs} \times 1\text{E-}6 \text{ kg/mg}}{365 \text{ days/yr} \times 70 \text{ yr} \times 15 \text{ kg}} \times \frac{7.3}{\text{mg/kg/day}} \times 10 = \mathbf{5.9E\text{-}7}$$

Age 2-6

$$\frac{0.022 \text{ mg/kg} \times 200 \text{ mg/day} \times 350 \text{ days/yr} \times 4 \text{ yrs} \times 1\text{E-}6 \text{ kg/mg}}{365 \text{ days/yr} \times 70 \text{ yr} \times 15 \text{ kg}} \times \frac{7.3}{\text{mg/kg/day}} \times 3 = \mathbf{3.5E\text{-}7}$$

Age 6-16

$$\frac{0.022 \text{ mg/kg} \times 100 \text{ mg/day} \times 350 \text{ days/yr} \times 10 \text{ yrs} \times 1\text{E-}6 \text{ kg/mg}}{365 \text{ days/yr} \times 70 \text{ yr} \times 70 \text{ kg}} \times \frac{7.3}{\text{mg/kg/day}} \times 3 = \mathbf{9.4E\text{-}8}$$

Age 16-30

$$\frac{0.022 \text{ mg/kg} \times 100 \text{ mg/day} \times 350 \text{ days/yr} \times 14 \text{ yrs} \times 1\text{E-}6 \text{ kg/mg}}{365 \text{ days/yr} \times 70 \text{ yr} \times 70 \text{ kg}} \times \frac{7.3}{\text{mg/kg/day}} \times 1 = \mathbf{4.4E\text{-}8}$$

Total Risk
5.9E-7 + 3.5E-7 + 9.4E-8 + 4.4E-8 = 1E-6

2. Tap water

Sample chemical = Dibromochloropropane (VOC)
PRG = 2E-4 ug/L

A. Ingestion risk

Age 0-2

$$\frac{0.0002 \text{ ug/L} \times 1 \text{ L/day} \times 350 \text{ days/yr} \times 2 \text{ yrs} \times 1\text{E-}3 \text{ mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 15 \text{ kg}} \times \frac{0.8}{\text{mg/kg/day}} \times 10 = \mathbf{2.9E\text{-}9}$$

Age 2-6

$$\frac{0.0002 \text{ ug/L} \times 1 \text{ L/day} \times 350 \text{ days/yr} \times 4 \text{ yrs} \times 1\text{E-}3 \text{ mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 15 \text{ kg}} \times \frac{0.8}{\text{mg/kg/day}} \times 3 = \mathbf{1.8E\text{-}9}$$

Age 6-16

$$\frac{0.0002 \text{ ug/L} \times 2 \text{ L/day} \times 350 \text{ days/yr} \times 10 \text{ yrs} \times 1\text{E-}3 \text{ mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 70 \text{ kg}} \times \frac{0.8}{\text{mg/kg/day}} \times 3 = \mathbf{1.9E\text{-}9}$$

Age 16-30

$$\frac{0.0002 \text{ ug/L} \times 2 \text{ L/day} \times 350 \text{ days/yr} \times 14 \text{ yrs} \times 1\text{E-3 mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 70 \text{ kg}} \times \frac{0.8}{\text{mg/kg/day}} \times 1 = \mathbf{8.8E\text{-}10}$$

Total Ingestion Risk

2.9E-9 + 1.8E-9 + 1.9E-9 + 8.8E-10 = 7.5E-9

B. Inhalation risk

Age 0-2

$$\frac{2\text{E-4 ug/L} \times 0.5 \text{ L/m}^3 \times 12 \text{ m}^3\text{/dy} \times 350 \text{ dy/yr} \times 2 \text{ yrs} \times 1\text{E-3 mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 15 \text{ kg}} \times \frac{21}{\text{mg/kg/day}} \times 10 = \mathbf{4.6E\text{-}7}$$

Age 2-6

$$\frac{2\text{E-4 ug/L} \times 0.5 \text{ L/m}^3 \times 12 \text{ m}^3\text{/dy} \times 350 \text{ dy/yr} \times 4 \text{ yrs} \times 1\text{E-3 mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 15 \text{ kg}} \times \frac{21}{\text{mg/kg/day}} \times 3 = \mathbf{2.8E\text{-}7}$$

Age 6-16

$$\frac{2\text{E-4 ug/L} \times 0.5 \text{ L/m}^3 \times 20 \text{ m}^3\text{/dy} \times 350 \text{ dy/yr} \times 10 \text{ yrs} \times 1\text{E-3 mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 70 \text{ kg}} \times \frac{21}{\text{mg/kg/day}} \times 3 = \mathbf{2.5E\text{-}7}$$

Age 16-30

$$\frac{2\text{E-4 ug/L} \times 0.5 \text{ L/m}^3 \times 20 \text{ m}^3\text{/dy} \times 350 \text{ dy/yr} \times 14 \text{ yrs} \times 1\text{E-3 mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 70 \text{ kg}} \times \frac{21}{\text{mg/kg/day}} \times 1 = \mathbf{1.2E\text{-}7}$$

Total Inhalation Risk

4.6E-7 + 2.8E-7 + 2.5E-7 + 1.2E-7 = 1E-6

Total Tap Water Risk

7.5E-9 + 1E-6 = 1E-6

3. Air

Sample chemical = Benzidine

A. Dose-Based Method (Using CSF in 1/mg/kg/day)

PRG = 1E-5 ug/m^3

Age 0-2

$$\frac{1\text{E-5 ug/m}^3 \times 12 \text{ m}^3\text{/day} \times 350 \text{ days/yr} \times 2 \text{ yrs} \times 1\text{E-3 mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 15 \text{ kg}} \times \frac{230}{\text{mg/kg/day}} \times 10 = \mathbf{5E\text{-}7}$$

Age 2-6

$$\frac{1\text{E-5 ug/m}^3 \times 12 \text{ m}^3\text{/day} \times 350 \text{ days/yr} \times 4 \text{ yrs} \times 1\text{E-3 mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 15 \text{ kg}} \times \frac{230}{\text{mg/kg/day}} \times 3 = \mathbf{3E\text{-}7}$$

Age 6-16

$$\frac{1E\text{-}5\ ug/m^3 \times 20\ m^3/day \times 350\ days/yr \times 10\ yrs \times 1E\text{-}3\ mg/ug}{365\ days/yr \times 70\ yr \times 70\ kg} \times \frac{230}{mg/kg/day} \times 3 = \mathbf{2.7E\text{-}7}$$

Age 16-30

$$\frac{1E\text{-}5\ ug/m^3 \times 20\ m^3/day \times 350\ days/yr \times 14\ yrs \times 1E\text{-}3\ mg/ug}{365\ days/yr \times 70\ yr \times 70\ kg} \times \frac{230}{mg/kg/day} \times 1 = \mathbf{1.3E\text{-}7}$$

Total Risk

5E-7 + 3E-7 + 2.7E-7 + 1.3E-7 = 1E-6

B. Concentration-Based Method (Using IUR in m^3/ug).

PRG = 1.5E-5 ug/m^3

Age 0-2

$$\frac{1.5E\text{-}5\ ug/m^3 \times 350\ days/yr \times 2\ yrs}{365\ days/yr \times 70\ yr} \times \frac{0.067}{ug/m^3} \times 10 = \mathbf{2.8E\text{-}7}$$

Age 2-6

$$\frac{1.5E\text{-}5\ ug/m^3 \times 350\ days/yr \times 4\ yrs}{365\ days/yr \times 70\ yr} \times \frac{0.067}{ug/m^3} \times 3 = \mathbf{1.7E\text{-}7}$$

Age 6-16

$$\frac{1.5E\text{-}5\ ug/m^3 \times 350\ days/yr \times 10\ yrs}{365\ days/yr \times 70\ yr} \times \frac{0.067}{ug/m^3} \times 3 = \mathbf{4.1E\text{-}7}$$

Age 16-30

$$\frac{1.5E\text{-}5\ ug/m^3 \times 350\ days/yr \times 14\ yrs}{365\ days/yr \times 70\ yr} \times \frac{0.067}{ug/m^3} \times 1 = \mathbf{1.9E\text{-}7}$$

Total Risk

2.8E-7 + 1.7E-7 + 4.1E-7 + 1.9E-7 = 1E-6

Fish Tissue and Industrial Soil RBCs:
Because these RBC scenarios involve adults only, the ADAFs for early-life exposure do not apply. Therefore, these RBCs are derived in the traditional manner and are not shown in this memo.

1.0 INTRODUCTION

The purpose of this appendix is to present and describe development of exposure assessment models for the receptors presented in Section 7.0, the Screening Level Ecological Risk Assessment (SLERA) at SWMUs 40 and 71. The following sections provide a summary of parameters used in the models and a detailed description of the direct contact and dose rate modeling approachs used in the SLERA. The complete SLERAs for SWMU 40 and SWMU 71 are presented in Appendices F.2 and F.3, respectively.

2.0 MODEL PARAMETERS

The direct contact and dose rate models include parameters relating to receptor-specific exposure, chemical of potential concern (COPC) toxicity, and bioaccumulation rates. The following sections describe the estimation of these parameters and major assumptions of parameterization.

2.1 TOXICITY REFERENCE VALUES

MDCs for detected chemicals in soil are used as the preliminary exposure estimate to evaluate a conservative risk scenario for the direct contact pathway to soil invertebrates. Other potentially complete exposure pathways to soil invertebrate and microbial communities include direct ingestion of soil and biota. Due to insufficient information to quantify these pathways, likely secondary to the direct contact/absorption pathway, their omission should not substantially alter the risk characterization.

To evaluate the preliminary exposure estimates, the Toxicity Reference Values (TRVs) that were protective of terrestrial plants and soil invertebrate/microbial communities, were selected from a review of toxicological benchmarks for soil. TRVs for direct contact of soil to invertebrates/microbes and soil to plants were determined from the following guidance:

- USEPA Ecological Soil Screening Level (ECO-SSL): soil invertebrate and plant;
- Oak Ridge National Laboratory (ORNL): plant, microbial community, earthworm values (Efroymson *et al*. 1997a, Efroymson *et al*. 1997b, Efroymson *et al*. 1997c); and
- USEPA Region III Biological Technical Assistance Group (BTAG) soil screening values (USEPA 1995), BTAG freshwater screening benchmarks (USEPA 2006a), and BTAG freshwater sediment screening levels (USEPA 2006b)

Selected screening levels and sources are reported on Tables F.2-5 (SWMU 40) and F.3-5 (SWMU 71) for terrestrial plants and Tables F.2-7 (SWMU 40) and F.3-7 (SWMU 71) for soil invertebrates and microbial communities.

2.2 RECEPTOR-SPECIFIC EXPOSURE PARAMETERS

Wildlife receptors selected to characterize exposure at SWMUs 40 and 71 include:

- Herbivorous mammals: Meadow Vole (*Microtus pennsylvanicus*);
- Invertivorous mammals: Short-tailed Shrew (*Blarina brevicauda*);
- Invertivorous birds: American Robin (*Turdus migratorius*);
- Carnivorous birds: Red-tailed Hawk (*Buteo jamaicensis*); and
- Carnivorous mammals: Red Fox (*Vulpes vulpes*).

Exposure parameters used to derive TRV-based substrate concentrations for each receptor include body weight (kg), food ingestion rate (kg dry weight/day), dietary fraction, incidental substrate ingestion rate (kg dry weight/day), and area use factor. Both preliminary and refinement level exposure parameters are presented in Table F.2-9 (SWMU 40) and Table F.3-9 (SWMU 71).

2.3 LITERATURE-BASED NOAEL AND LOAEL VALUES

The dose-response relationships for chemicals of potential concern are expressed as NOAELs and LOAELs for wildlife receptors, which are defined as a daily ingested amount (mg/kg body weight-day) that is associated with a specified effect. This process involves the determination of a "test species dose" for a critical endpoint from a particular experimental combination of exposure concentration, exposure duration, test species, and chemical. Endpoints may be based on growth, reproductive, developmental, and survival effects. Such effects are important because they may affect the abundance or reproductive success of receptor populations. The test-species dose from the selected study is then modified using extrapolation and uncertainty factors (EFs and UFs).

For this evaluation, EFs and UFs are used to modify laboratory study results, based on the methodology of Sample et al. (1996). This process involves the determination of a "test species dose" for a critical endpoint from a particular experimental combination of exposure concentration, exposure duration, test species, and chemical. The test-species dose from the selected study is then modified to account for the various extrapolations and uncertainties inherent in applying results from a controlled setting to an ecologically relevant setting, as in:

$$\text{NOAEL or LOAEL} = \frac{\text{Test-Species Dose}}{\text{Duration UF} \times \text{Endpoint UF}} \times \text{Body-Weight EF}$$

EFs and UFs are based on: (1) the duration of exposure, (2) the endpoint measured, and (3) differences in body weights among test and receptor species (Calabrese and Baldwin 1993, Ford et al. 1992, Opresko et al. 1994, Sample et al. 1996, USEPA 1996, Wentsel et al. 1994). EFs and UFs derivation and use is described in the following subsections. The use of surrogate chemical data is also discussed. NOAEL and LOAELs for COPCs are summarized in Table F.2-10 (SWMU 40) and Table F.3-10 (SWMU 71).

2.3.1 The Test-Species Dose

Critical toxicological values are identified from carefully qualified primary and secondary literature references. The selection of particular studies and endpoints used for the derivation of NOAELs and LOAELs is based on the evaluation of the applicable studies and the dose-response data contained therein. In cases where preferred toxicological endpoints are not available, other toxicity values are used, but additional uncertainty factors may be incorporated. All toxicological values chosen for NOAEL and LOAEL derivation are presented on a mg chemical per kg body weight per day (mg/kg BW-day) basis. These units allow comparisons among organisms of different body sizes (Sample et al. 1996).

2.3.2 Duration Uncertainty Factors

Exposure durations of interest include (1) chronic, (2) subchronic, and (3) acute. Chronic studies occur over the lifetime or a majority of the lifespan of the test organism, generally longer than one year for mammals and 10 weeks for birds. Additionally, studies in which the test organism is dosed during a critical life stage (e.g., gestation) are included with chronic duration studies. Subchronic studies include exposures of two weeks to one year in duration that do not occur during a critical life stage. Acute studies typically have exposures of less than two weeks. NOAELs and LOAELs are usually reported from chronic and subchronic studies, with acute studies often reporting LD_{50} levels (LD_{50}; doses corresponding to the overt expression of a serious adverse effect such as mortality in 50% of test animals). Test-species doses from chronic studies are used preferentially over data from acute and subchronic studies. In cases where chronic data are not available as test-species doses, studies involving less-than-chronic exposures are used to in NOAEL and LOAEL derivation with the addition of a duration uncertainty factor.

For this study, duration uncertainty factors are applied according to USACHPPM 2000:

- Subchronic NOAEL to Chronic NOAEL: 10
- Subchronic LOAEL to Chronic NOAEL: 20

- Subchronic LOAEL to Chronic LOAEL: 4
- Acute NOAEL to Chronic NOAEL: 30
- Acute LOAEL to Chronic NOAEL: 50
- Acute LOAEL to Chronic LOAEL: 10

2.3.3 Endpoint Uncertainty Factors

Additional UFs are used to account for uncertainties in extrapolation between effect- and no-effect levels. Specifically, a NOAEL test-species dose may be estimated from a LOAEL (or LD_{50}) value, or a LOAEL may be estimated from a LD_{50}.

Extrapolation from a LOAEL or LD_{50t} to a NOAEL: Consistent with USACHPPM 2000, a UF of 10 is used with chronic LOAEL values to estimate the chronic NOAEL, which is considered conservative (Sample et al. 1996, USEPA 1996). When a LOAEL value is not available, a LD_{50} is used, although chronic NOAELs may range from 1/10 to 1/10,000 of the corresponding acute LD_{50} value (Opresko et al. 1994). For this report, an uncertainty factor of 100 is used to estimate a NOAEL value from a LD_{50} value (USACHPPM 2000).

Extrapolation from an LD_{50} to a LOAEL: Consistent with USACHPPM 2000, an UF of 20 is used conservatively to estimate a LOAEL value from a LD_{50} value (USACHPPM 2000).

2.3.4 Body-Weight Extrapolation Factor

This extrapolation is accomplished using a body weight-scaling factor to account for differences in body size (Sample et al. 1996). Numerous studies have shown that many physiological functions such as metabolic rates and responses to chemicals are a function of body size for mammals. Smaller mammals have higher metabolic rates and are usually more resistant to chemicals because of more rapid rates of detoxification. It has been shown that the best measure of body size is one based on body surface-area, which can be expressed in terms of body weight raised to a fractional power (Opresko et al. 1994, Sample et al. 1996, USEPA 1980). Dosimetric differences between the mammalian test species and wildlife receptors are accounted for using:

$$\mathrm{NOAEL}_w = \mathrm{NOAEL}_t \times \left(\frac{\mathrm{BW}_t}{\mathrm{BW}_w} \right)^{0.25}$$

where:

$NOAEL_w$	= NOAEL for the mammalian wildlife receptor (mg/kg BW-day)
$NOAEL_t$	= NOAEL for the mammalian test species (mg/kg BW-day)
BW_t	= Test species body weight (kg)
BW_w	= Wildlife receptor body weight (kg)

Scaling factors may not be appropriate for avian interspecies extrapolations. Information has shown that adjustment factors based on body size for interspecies extrapolation among avian species range from 0.63 to 1.55 (Sample et al. 1996). Therefore, a body-weight extrapolation factor is not used to derive avian NOAELs and LOAELs.

Mammalian wildlife receptor body weights are presented on Tables F.2-9 (SWMU 40) and F.3-9 (SWMU 71) and laboratory test species body weights are presented on Tables F.2-10 (SWMU 40) and F.3-10 (SWMU 71).

2.4 BIOACCUMULATION FACTORS

Bioaccumulation factors (BAFs) provide quantitative indicators of the tendency for a chemical to partition into terrestrial organisms, relative to the concentrations present in terrestrial exposure media. Exposure-point concentrations of chemicals in terrestrial prey (soil invertebrates and small mammals) and terrestrial plants are estimated using BAFs derived from the literature. The derivation of BAFs is described for organic and inorganic chemicals in the following subsections.

2.4.1 Terrestrial Plants

Exposure-point concentrations of chemicals in terrestrial plants are estimated using soil-to-plant bioaccumulation factors (uptake factors for plants, UF_{plant}) derived from the literature. UF_{plant} values are used to estimate wet-weight chemical concentrations in terrestrial plants using the same equation for invertebrates and a dry weight to wet weight conversion factor assuming plants are 80% water (Salisbury and Ross 1992). Tables F.2-11 (SWMU 40) and F.3-11 (SWMU 71) present the uptake factors for plants.

Organic Chemicals: Organic chemicals may enter the plant by partitioning from contaminated soil to the roots and then translocating throughout the plant via the xylem tissue. Most bioaccumulative, lipophilic organic chemicals partition to the epidermis of the root or adhere to soil particles and are not drawn into the inner root or xylem (Paterson et al. 1990). Uptake factors for estimating concentrations of organic chemicals in plant tissues are derived from the following equation:

$$UF_{plant} = 10^{[1.588-(0.578\times \log K_{ow})]}$$

where:

UF_{plant} = Plant uptake factor (kg soil, dry weight / kg plant, dry weight)

$\log K_{ow}$ = Logarithm of the octanol:water partition coefficient

This relationship is based on a linear regression of bioaccumulation factors for 29 organic chemicals (Travis and Arms 1988). The correlation coefficient for the regression is 0.73, indicating that a majority of the variability in bioaccumulation is explained by the log K_{ow}. UF_{plant} values are derived for organic chemicals using this equation.

Inorganic Chemicals: Concentrations of inorganic chemicals in plant tissues are estimated based on generalized soil-to-plant transfer coefficients reported in a literature review. The soil-to-plant transfer factors for inorganic chemicals are equivalent to UF_{plant} values for organic chemicals and represent the ratio of the dry weight concentrations in plant tissue to the dry weight concentration of the element in root-zone soils. Bechtel-Jacobs 1998 C_p regression equation: $C_p = e^{(slope*\ln(Cs) - intercept)}$

2.4.2 Terrestrial Prey

Organic Chemicals: BAFs for estimating concentrations of organic chemicals in prey tissues are derived from linear regression equations presented in Travis and Arms (1998) and Beyer and Stafford (1993). The dry weight to wet weight (DW:WW) conversion factor is 0.2 for soil invertebrates (kg soil invertebrate dry weight per soil invertebrate wet weight; assumes invertebrates are 80% water), based on data reported in USEPA (1993). No DW:WW conversion factor was applied for small mammals. The BAF values used in to estimate concentrations of organic chemicals in soil invertebrates and small mammals are shown in Tables F.2-12 and F.2-13 (SWMU 40) and F.3-12 and F.3-13 (SWMU 71).

Inorganic Chemicals: Inorganic bioaccumulation factors for terrestrial prey (Tables F.2-13 and F.3-13) are wet-weight-based and are used to predict concentrations in invertebrates and small mammals according to:

$$BAF_{si} = C_{si} / C_{soil}$$

where:

BAF_{si} = Soil invertebrate uptake factor for inorganic chemicals

C_{si} = Chemical concentration predicted in soil invertebrates (mg chemical / kg soil invertebrate, dry weight)

C_{soil} = Concentration of inorganic chemical in soil (mg chemical / kg soil, dry weight)

2.5 TOXICITY EQUIVALENCY FACTORS

Dioxin/furan COPCs represent a group of 17 polychlorinated dioxin/furan congeners of 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). These congeners induce toxicity by binding to the aryl hydrocarbon (Ah) receptor, a cellular protein. All congeners are not equally toxic relative to TCDD (USEPA 1999). Therefore, the toxicity of each congener relative to TCDD is expressed in terms of a Toxicity Equivalency Factor (TEFs) established for mammals, birds, and fish (Van den Berg et. all 1998). The aggregate toxicity of a mixture of dioxins/furans in an exposure medium is expressed as TCDD-equivalents ($TEQ_{2,3,7,8\ TCCD}$), which are calculated as the TEF-weighted sum of the average daily dose (ADD_i) of the 17 congeners. $TEQ_{2,3,7,8\ TCCD}$ is calculated as follows:

$$TEQ_{2,3,7,8TCDD} = \sum_{i=1}^{17} ADD_i \times TEF_i$$

Determining the aggregate toxicity of the 17 dioxin/furan congeners in terms of $TEQ_{2,3,7,8\ TCCD}$ enables direct comparison to toxicological benchmarks developed for 2,3,7,8 TCDD (USEPA 1999). Therefore, NOAELs and LOAELs derived in the literature are used for direct evaluation of ecological effects resulting from $TEQ_{2,3,7,8\ TCCD}$ exposure.

Tables F.2-2 and F.3-2 present the total 2,3,7,8 TCDD TEQs calculated for SWMUs 40 and 71, respectively.

3.0 DIRECT CONTACT APPROACH

3.1 PRELIMINARY DIRECT CONTACT TOXICITY EVALUATION

Risk is assessed by comparing the preliminary exposure estimate (maximum detected concetrations - MDC) of each detected chemical to the established TRV (detailed in Section 2.1). The preliminary risk is characterized in terms of a hazard quotient (HQ), which is expressed as:

HQ = MDC/TRV

where:

HQ = Hazard Quotient for the contaminant (unitless)
MDC = Maximum Detected Concentration for contaminant (mg/kg)
TRV = Screening Level for contaminant (mg/kg)

3.2 REFINED DIRECT CONTACT TOXICITY EVALUATION

For the refined evaluation, risk is assessed by comparing the exposure point concentration (EPC) of each detected chemical to the TRV (Section 7.1.6 details EPC development). The refined risk HQ is expressed as:

HQ = EPC/TRV

where:

HQ = Hazard Quotient for the contaminant (unitless)
EPC = Calculated Exposure Point Concentration for contaminant (mg/kg)
TRV = Screening Level for contaminant (mg/kg)

An HQ of less than 1 indicates no or negligible risk. The potential for risk increases as the HQ increases above unity. However, this result should be considered in the context of other characteristics of the exposure area.

Results of the direct contact toxicity evaluation for SWMU 40 are presented in Tables F.2-6 (terrestrial plants) and F.2-8 (soil and microbial communities) and SWMU 71 results are presented in Tables F.3-6 (terrestrial plants) and F.3-8 (soil and microbial .

4.0 DOSE RATE MODELING APPROACH

A simplified food web model is utilized to calculate TRVs for each chemical and wildlife receptor. TRVs quantify COPC concentrations in exposure media that may result in no observable adverse effects or low observable adverse effects. The NOAEL corresponds to the greatest exposure associated with no observed adverse effects on growth, reproduction, or survival. The LOAEL corresponds to the smallest exposure associated with observed adverse effects on growth, reproduction or survival. TRVs developed by dose rate models are used to evaluate ecological effects associated with COPEC concentrations in exposure media.

4.1 PRELIMINARY DOSE RATE MODEL

Preliminary risk characterization for wildlife receptors uses the conservative preliminary exposure estimate and ecological effects evaluation to characterize risk to potential terrestrial receptors.

The simplified food web model considers the ingestion of prey, the incidental ingestion of media, and the primary routes of exposure to wildlife receptors. Chemical concentrations in prey are expressed as a function of chemical concentrations in exposure media using BAFs for terrestrial prey items. Other important parameters in the model include receptor body weight and an estimate of receptor use. As shown in the equation below, literature-derived NOAEL and LOAEL values are input into the model as the ADD variable to calculate the concentration in exposure media (C_{TRV}) that would result in a dose equivalent to a NOAEL or LOAEL.

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \ (BAF_{food} \cdot DF) + IR_s)AF}$$

where:

C_{TRV} = NOAEL or LOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg COPC/kg body weight-day)

BW = Minimum Body Weight of the receptor (kg)

IR_{food} = Maximum Ingestion Rate of food (kg food ingested per day, dry weight)

BAF_{food} = BAF of most contaminated dietary component used, specific to prey type and COPC (ratio of mg of COPC/kg fauna, wet weight to mg COPC/ kg substrate, dry weight)

DF = Dietary Fraction (most contaminated dietary component assumed to be 100% of diet)

IR_s = Maximum Incidental Ingestion Rate of soil (kg substrate ingested per day, dry weight)

AF = 100% Area Use Factor

Preliminary receptor parameters for SWMUs 40 and 71 are presented on Tables F.2-9 and F.3-9, respectively. The resulting risk is characterized in terms of an HQ and is presented for wildlife receptors in Appendix F.2 and summarized in Table F.2-24 for SWMU 40 and in Appendix F.3 and summarized in Table F.3-24 for SWMU 71.

4.2 REFINED EXPOSURE ESTIMATE AND RISK CHARACTERIZATION

The refined exposure and risk characterization, Step 3a of the ecological risk assessment guidance (ERAGS), reviews and refines the conservative assumptions used in the risk calculation (USEPA 1997). In Step 3a, conservative assumptions used in the preliminary exposure and risk characterization are replaced with more environmentally realistic assumptions to evaluate risk posed by COPECs identified in the preliminary risk characterization. The addition of Step 3a focuses the outcome of the ecological screening, streamlines the review process and functions as the initial basis for ecological risk management decision-making at each site.

4.3 REFINED DOSE RATE MODEL

This step replaces the conservative assumptions used in the preliminary exposure estimate and ecological effects evaluation with more environmentally realistic assumptions including the use of average body weight, average food and substrate ingestion rates, and the use of realistic area use factor, resulting in a more realistic estimate of potential risk.

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + IR_s)AF}$$

where:

C_{TRV} = NOAEL or LOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg COPC/kg body weight-day)

BW = Average Body Weight of the receptor (kg)

IR_{food} = Average Ingestion Rate of food (kg food ingested per day, dry weight)

BAF_{food} = BAF of dietary component used, specific to prey type and COPC (ratio of mg of COPC/kg fauna, wet weight to mg COPC/ kg substrate, dry weight)

DF = Dietary Fraction

IR_s = Average Incidental Ingestion Rate of soil (kg substrate ingested per day, dry weight)

$AF_{refined}$ = Refined Area Use Factor (detailed below)

In the refined model, a realistic area use factor ($AF_{refined}$) was used to calculate the ratio of the study area (2 acres) to the average home range of the receptor:

$$AF_{refined} = \text{Study Area/Home Range Area}$$

Other receptor parameters in the refined model remain conservative. The conservative assumptions are summarized as follows:

- Receptors assimilate 100% of COPECs detected in the food and soil; and
- Receptors forage in the site area 100% of the time.

Refined receptor parameters for SWMU 40 and SWMU 71 are presented on Tables F.2-9 and F.3-9, respectively. The resulting risk is characterized in terms of an HQ and is presented for wildlife receptors in Appendix F.2 and summarized in Table F.2-24 for SWMU 40 and in Appendix F.3 and summarized in Table F.3-24 for SWMU 71.

4.4 EXAMPLE C_{TRV} EQUATION CALCULATION – PRELIMINARY AND REFINED

The following example C_{TRV} equation details the arsenic NOAEL-based screening level (SL) calculated for the short-tailed shrew at SWMU 40 (Tables F.2-16 and F.2-17) and resulting HQs:

Preliminary

- ADD = 0.15 mg/kg bw-day (NOAEL)
- BW = 0.0125 kg (minimum body weight)
- IR_{food} = 0.003 kg dw/day (maximum ingestion rate)
- BAF_{food} = 1.1 (for the most contaminated dietary component in this case plant)
- DF = 1 (100% most contaminated dietary component in this case 100% plants)
- IR_{soil} = 0.00031 kg dw/day (maximum soil ingestion rate)
- AF = 1 (default used)

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}\ (BAF_{food} \cdot DF) + IR_s)AF} = \frac{0.15 \cdot 0.0125}{(0.003\,(1.1 \cdot 1) + 0.00031) \cdot 1} = \textbf{5.2E-01 mg/kg}$$

NOAEL HQ = MDC (mg/kg)/NOAEL-based SL (mg/kg) = $\frac{55}{5.2E-01}$ = **1.1E+02**

EPC NOAEL HQ = NOAEL HQ * (EPC (mg/kg) / MDC (mg/kg)) = 1.1E+02*($\frac{25.61}{55}$) = **4.9E+01**

Refined

- ADD = 0.15 mg/kg bw-day
- BW = 0.015 kg
- IR_{food} = 0.002 kg dw/day
- BAF_{plant} = 0.038
- BAF_{inv} = 0.00931
- DF_{plant} = 0.14
- DF_{inv} = 0.86
- IR_{soil} = 0.00021 kg dw/day
- $AF_{refined}$ = 1

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF_{food}) + IR_s)AF}$$

$$= \frac{0.15 \cdot 0.015}{(0.002\,(0.038 \cdot 0.14 + 0.00931 \cdot 0.86) + 0.00021) \cdot 0.59} = \textbf{5.9+00 mg/kg}$$

NOAEL HQ = EPC (mg/kg)/NOAEL-based SL (mg/kg) = $\frac{25.61}{5.9E+00}$ = **4.3E+00**

Tables F.2-24 and F.3-24 provides a summary of preliminary and refined HQs developed for terrestrial receptors at SWMUs 40 and 71, respectively.

5.0 SUMMARY

Receptor-specific exposure parameters are obtained from life history studies found in the literature. Important receptor-specific exposure parameters input into the model include: body weight, food ingestion rate, diet composition, incidental substrate ingestion rate, and area use factor.

The dose-response relationships for chemicals of potential interest are expressed as NOAELs and LOAELs for wildlife receptors, which are defined as a daily ingested amount (mg COPC/kg body weight-day) that is associated with a specified growth, reproductive, developmental, or survival effect. Extrapolation and uncertainty factors are applied to literature-based toxicological endpoints to account for differences in a controlled laboratory setting and an ecologically relevant setting. Extrapolation and uncertainty factors are based on: (1) the duration of exposure, (2) the endpoint measured, and (3) differences in body weights among test and receptor species.

Bioaccumulation accumulation factors provide quantitative indicators of the tendency for a chemical to partition into organisms, relative to the concentrations present in exposure media. Exposure-point concentrations of chemicals in terrestrial prey (soil invertebrates and small mammals) are estimated using several BAFs derived from the literature.

COPC concentrations in prey and media, receptor-specific exposure parameters, literature-based NOAEL and LOAEL values, and bioaccumulation factors are used in the model to calculate the concentration in exposure media (C_{TRV}) that would result in a dose equivalent to a NOAEL or LOAEL. The dose rate modeling approach is used to evaluate the potential mobility of COPCs through varying trophic associations.

Notes:

CAS = Chemical Abstracts Service
COPEC = Chemical of Potential Ecological Concern
mg/kg = Milligram Per Kilogram
µg/kg = Microgram Per Kilogram
pg/g = Picogram Per Gram
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
PAH = Polynuclear Aromatic Hydrocarbon
TEQ = Toxicity Equivalent
DRO = Diesel Range Organics
GRO = Gasoline Range Organics

VQ = Validation Qualifier
r = Reason Code

Total 2,3,7,8-TCDD Equivalents are calculated by summing the detected concentration times the TEF for each chemical. Non-detects, R-flagged data, and B-flagged data are excluded from summed total.

Qualifiers:

J	Analyte present. Reported value may not be accurate or precise.
U	The compound was analyzed for but not detected. The reporting limit will be adjusted to reflect any dilution, and for soil, the percent moisture.
X	Associated PCDF peak(s) has the same retention time as the associated diphenyl ether and the diphenyl ether contribution is greater than 10%.
w	Retention time failure.

Screening Level Ecological Risk Assessment - SWMU 40
SWMUs 40 and 71 RFI/CMS Report
Radford Army Ammunition Plant, Radford, Virginia

							Preliminary Assessment					Refined Assessment					
Representative Species			Composition of Diet [1] (%)				Minimum Body Weight [1]	Maximum Body Weight [1]	Maximum Food Ingestion Rate [2]	Maximum Substrate Ingestion Rate [1]		Average Body Weight [1]	Average Food Ingestion Rate [2]	Average Substrate Ingestion Rate [1]	Home Range (ha)	Proportion of Year Species Active	AUFs
Food-web Classification	Common Name	Scientific Name	Plants (incl. fungi)	Inverte-brates	Small mammals	Fish	kg	kg	kg dw/day	% of dry intake	kg dry wt./day	kg	kg dw/day	kg dry wt./day			Study Area (0.8) hectares
Birds																	
soil-probing invertivore	American robin	*Turdus migratorius*	62%	38%			0.0635	0.103	0.020	5%	0.001	0.077	0.016	0.0008	0.48	1	1
large carnivore	Red-tailed hawk	*Buteo jamaicensis*			100%		0.957	1.235	0.063	0%	0	1.134	0.059	0	250	1	0.0032
Mammals																	
small herbivore	Meadow vole	*Microtus pennsylvanicus*	100%				0.017	0.0524	0.010	2.4%	0.00024	0.037	0.008	0.00019	0.037	1	1
medium carnivore	Red fox	*Vulpes vulpes*	17%	4%	79%		2.95	7.04	0.342	2.8%	0.0096	4.53	0.238	0.0067	96	1	0.0084
small invertivore	Short-tailed shrew	*Blarina brevicauda*	14%	86%			0.0125	0.0225	0.003	13%	0.00039	0.015	0.002	0.00026	0.39	1	1

Notes:
kg = Kilogram
kg dw/day = Kilogram Dry-weight per Day
L/day = Liter per Day

[1]Wildlife Exposure Factors Handbook. U.S. Environmental Protection Agency (EPA). 1993. Office of Research and Development. 2 Volumes. EPA/600/R93/187a&b. December.
[2] Estimated food intake rate (kg [dw]/day) calculated as follows:
FI ((kg/day) = 0.0687 $Wt.^{0.882}$ for mammals (red fox and short-tailed shrew)
FI ((g/day) = 0.577 $Wt.^{0.727}$ for herbivores (meadow vole)
FI ((g/day) = 0.301 $Wt.^{0.751}$ for non-passerine birds (red-tailed hawk)
FI ((g/day) = 0.398 $Wt.^{0.850}$ for passerine birds (american robin)
The soil ingestion rate for the american robin set equal to 38% of the american woodcock value (0.34*10.4%=4%), based on a robin diet of 38% invertbrates.

Notes:
CAS = Chemical Abstract Service
TRV = Toxic Reference Value
NOAEL = No observable adverse effects level
LOAEL = Lowest observable adverse effects level
mg/kg = Milligram Per Kilogram
bw/d = Body Weight Per Day
kg = kilogram
PAH = Polynuclear Aromatic Hydrocarbon
PCB = Polychlorinated Biphenyl
USACE = U.S. Army Corps of Engineers
ORNL = Oak Ridge National Laboratory
NOAEL and LOAEL values were derived from acute values by applying an uncertainty factor of 150.

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.2-10

BW = Minimum Body Weigth of Receptor (kg)

IR_{food} = Maximum Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)

DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = 100% Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

EPC = Exposure Point Concentration

Meadow Vole Specific Data from Table F.2-9

BW=	0.017	kg
IR_{food} =	0.010	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00024	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Concentration

LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Concentration

EPC NOAEL HQ = NOAEL HQ * (EPC/Maximum Detected Concentration)

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.2-10

BW = Minimum Body Weigth of Receptor (kg)

IR_{food} = Maximum Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)

DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = 100% Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

EPC = Exposure Point Concentration

Short-tailed Shrew Specific Data from Table F.2-9

BW=	0.0125	kg
IR_{food} =	0.003	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00039	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate soil screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Screening Level

LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Screening Level

EPC NOAEL HQ = NOAEL HQ * (EPC/Maximum Detected Concentration)

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.2-10

BW = Minimum Body Weigth of Receptor (kg)

IR_{food} = Maximum Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)

DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = 100% Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

EPC = Exposure Point Concentration

Red FoxSpecific Data from Table F.2-9

BW=	2.9500	kg
IR_{food} =	0.342	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00960	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Screening Level

LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Screening Level

EPC NOAEL HQ = NOAEL HQ * (EPC/Maximum Detected Concentration)

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.2-10

BW = Minimum Body Weigth of Receptor (kg)

IR_{food} = Maximum Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)

DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = 100% Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

EPC = Exposure Point Concentration

American Robin Specific Data from Table F.2-9

BW=	0.0635	kg
IR_{food} =	0.020	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00100	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate soil screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Concentration

LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Concentration

EPC NOAEL HQ = NOAEL HQ * (EPC/Maximum Detected Concentration)

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.2-10

BW = Average Body Weigth of Receptor (kg)

IR_{food} = Average Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor, specific to prey type and chemical

DF = Dietary fraction

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

BDL = Below Detection Limit

EPC = Exposure Point Concentration

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + (IR_s)) \cdot AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = EPC/Calculated NOAEL-Based Screening Level

LOAEL HQ = EPC/Calculated LOAEL-Based Screening Level

Red-tailed Hawk Specific Data from Table F.2-9

BW=	1.134	kg
IR_{food} =	0.059	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{mam} =	1.00	unitless
IR_{soil} =	0.0	kg dw/day
AF =	0.0032	unitless

Notes:

CAS = Chemical Abstracts Service
COPEC = Chemical of Potential Ecological Concern
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
PAH = Polynuclear Aromatic Hydrocarbon
mg/kg = Milligram Per Kilogram
µg/kg = Microgram Per Kilogram

Total 2,3,7,8-TCDD Equivalents (Avian)				2.745		3.331	

Notes:

pg/g = Picogram Per Gram
ft bgs = Feet Below Ground Surface
TEF = Toxicity Equivalency Factor
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code

Total 2,3,7,8-TCDD Equivalents are calculated by summing the detected concentration times the TEF for each chemical. Non-detects, R-flagged data, and B-flagged data are excluded from summed total.

Qualifiers:

B	Not detected substantially above the level reported in laboratory or field blanks.
J	Analyte present. Reported value may not be accurate or precise.
U	The compound was analyzed for but not detected. The reporting limit will be adjusted to reflect any dilution, and for soil, the percent moisture.
X	Associated PCDF peak(s) has the same retention time as the associated diphenyl ether and the diphenyl ether contribution is greater than 10%.
l	LCS recovery failure.
w	Retention time failure.
z	Method blank contamination.

Notes:
kg = Kilogram
kg dw/day = Kilogram Dry-weight per Day
L/day = Liter per Day

[1]Wildlife Exposure Factors Handbook. U.S. Environmental Protection Agency (EPA). 1993. Office of Research and Development. 2 Volumes. EPA/600/R93/187a&b. December.
[2] Estimated food intake rate (kg [dw]/day) calculated as follows:
FI ((kg/day) = 0.0687 $Wt.^{0.882}$ for mammals (red fox and short-tailed shrew)
FI ((g/day) = 0.577 $Wt.^{0.727}$ for herbivores (meadow vole)
FI ((g/day) = 0.301 $Wt.^{0.751}$ for non-passerine birds (red-tailed hawk)
FI ((g/day) = 0.398 $Wt.^{0.850}$ for passerine birds (american robin)
The soil ingestion rate for the american robin set equal to 38% of the american woodcock value (0.34*10.4%=4%), based on a robin diet of 38% invertbrates.

Notes:
CAS = Chemical Abstract Service
TRV = Toxic Reference Value
NOAEL = No observable adverse effects level
LOAEL = Lowest observable adverse effects level
mg/kg = Milligram Per Kilogram
bw/d = Body Weight Per Day
kg = kilogram
PAH = Polynuclear Aromatic Hydrocarbon
PCB = Polychlorinated Biphenyl
USACE = U.S. Army Corps of Engineers
ORNL = Oak Ridge National Laboratory
NOAEL and LOAEL values were derived from acute values by applying an uncertainty factor of 150.

Notes:

CAS = Chemical Abstract Services
C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)
ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.3-10
BW = Minimum Body Weigth of Receptor (kg)
IR_{food} = Maximum Ingestion Rate for Food
BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)
DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)
IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)
AF = 100% Area Use Factor
NOAEL = No observable adverse effects level
LOAEL = Lowest observable adverse effects level
mg/kg = Milligram Per Kilogram
bw - day = Body Weight - Day
HQ = Hazard Quotient
TRV = Toxicity Reference Value
EPC = Exposure Point Concentration

Meadow Vole Specific Data from Table F.3-9

BW=	0.017	kg
IR_{food} =	0.010	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{plants} =	1.00	unitless
IR_{soil} =	0.00024	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Concentration
LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Concentration
EPC NOAEL HQ = NOAEL HQ * (EPC/Maximum Detected Concentration)

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.3-10

BW = Average Body Weigth of Receptor (kg)

IR_{food} = Average Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor, specific to prey type and chemical

DF = Dietary fraction

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

BDL = Below Detection Limit

EPC = Exposure Point Concentration

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + (IR_s)) \cdot AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = EPC/Calculated NOAEL-Based Screening Level

LOAEL HQ = EPC/Calculated LOAEL-Based Screening Level

Meadow Vole Specific Data from Table F.3-9

BW=	0.037	kg
IR_{food} =	0.008	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{plants} =	1.00	unitless
IR_{soil} =	0.00019	kg dw/day
AF =	1	unitless

Notes:

CAS = Chemical Abstract Services
C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)
ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.3-10
BW = Minimum Body Weigth of Receptor (kg)
IR_{food} = Maximum Ingestion Rate for Food
BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)
DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)
IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)
AF = 100% Area Use Factor
NOAEL = No observable adverse effects level
LOAEL = Lowest observable adverse effects level
mg/kg = Milligram Per Kilogram
bw - day = Body Weight - Day
HQ = Hazard Quotient
TRV = Toxicity Reference Value
EPC = Exposure Point Concentration

Short-tailed Shrew Specific Data from Table F.3-9

BW=	0.0125	kg
IR_{food} =	0.003	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00031	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate soil screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Screening Level
LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Screening Level
EPC NOAEL HQ = NOAEL HQ * (EPC/Maximum Detected Concentration)

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.3-10

BW = Average Body Weigth of Receptor (kg)

IR_{food} = Average Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor, specific to prey type and chemical

DF = Dietary fraction

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

BDL = Below Detection Limit

EPC = Exposure Point Concentration

Short-tailed Shrew Specific Data from Table F.3-9

BW=	0.015	kg
IR_{food} =	0.002	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{plants} =	0.14	unitless
DF_{inv} =	0.86	unitless
IR_{soil} =	0.00021	kg dw/day
AF =	1.000	unitless

[a] = The following equation was used to calculate soil screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + (IR_s)) \cdot AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = EPC/Calculated NOAEL-Based Screening Level

LOAEL HQ = EPC/Calculated LOAEL-Based Screening Level

Richmond, VA 23219

Subject: Natural Heritage Project Review

Dear Ms. Hypes:

I am writing to request information concerning threatened and endangered species potentially inhabiting the area in the vicinity of an industrial site located near the town of Radford, VA. URS is performing an ecological risk assessment of the site.

The site is located in the Valley and Ridge Province in western Montgomery County, VA. Land use surrounding the site is largely undeveloped due to steep terrain, although less rugged areas are primarily used for agriculture.

A portion of a topographic map (Radford North,VA quad) is attached which specifies the location of the site. Please perform a search of the area within a one-mile radius of this location and notify us of any threatened or endangered species and/or critical or protected habitats known to occur in this vicinity.

If you should have any questions concerning this request, please contact me at 215-542-3800. I thank you for your assistance in this matter.

Sincerely,

Gary R. Long
Staff Biologist

Re: Industrial Site, Valley and Ridge in western Montgomery County

Dear Mr. Long:

The Department of Conservation and Recreation's Division of Natural Heritage (DCR) has searched its Biological and Conservation Data System (BCD) for occurrences of natural heritage resources from the area outlined on the submitted map. Natural heritage resources are defined as the habitat of rare, threatened, or endangered plant and animal species, unique or exemplary natural communities, and significant geologic formations.

According to the topographic map, this project either overlies or is adjacent to a karst landscape characterized by sinkholes, caves, disappearing streams, and large springs. The project has been sent to the Virginia Karst Program and to the Virginia Speleological Survey for review for documented sensitive karst features and caves. A significant cave has been documented in the project vicinity. Please coordinate with the Virginia Karst Program at 540-831-4056 (worndorff@dcr.state.va.us) to avoid, minimize, or mitigate impacts.

Our files also do not indicate the presence of any State Natural Area Preserves under DCR's jurisdiction in the project vicinity.

Under a Memorandum of Agreement established between the Virginia Department of Agriculture and Consumer Services (VDACS) and the Virginia Department of Conservation and Recreation (DCR), DCR represents VDACS in comments regarding potential impacts on state-listed threatened and endangered plant and insect species. The current activity will not affect any documented state-listed plants or insects.

New and updated information is continually added to BCD. Please contact DCR for an update on this natural heritage information if a significant amount of time passes before it is utilized.

A fee of $ 95.00 has been assessed for the service of providing this information. Please find enclosed an invoice for that amount. Please return one copy of the invoice along with your remittance made payable to the Treasurer of Virginia, Department of Conservation and Recreation, 203 Governor Street, Suite 414, Richmond, VA 23219, ATTN: Cashier. Payment is due within thirty days of the invoice date.

Should you have any questions or concerns, feel free to contact me at 804-371-2708. Thank you for the opportunity to comment on this project.

Sincerely,

S. René Hypes
Project Review Coordinator

Re: Project #2918

Greetings:

The U.S. Fish and Wildlife Service (Service) has received your request to review the attached project for potential impacts to Federally listed or proposed endangered and threatened species and designated critical habitat in Virginia pursuant to the Endangered Species Act (ESA) of 1973 (87 Stat. 884, as amended; 16 U.S.C. 1531 *et seq.*). Attached is a list of species with Federal status and species of concern that have been documented or may occur in the county where your project is located. This list was prepared by this office and is based on information obtained from previous surveys for rare and endangered species.

In order to ensure coordination with the State agencies, we consistently recommend that individuals contact the Virginia Department of Conservation and Recreation, Division of Natural Heritage **and** the Virginia Department of Game and Inland Fisheries, since each agency maintains a different database and has differing expertise and/or regulatory responsibility. You can contact these agencies at the following addresses:

Virginia Department of Game and Inland Fisheries
Environmental Services Section
P.O. Box 11104
Richmond, VA 23230
(804) 367-1000

Virginia Department of Conservation and Recreation
Division of Natural Heritage
217 Governor Street, 2nd Floor
Richmond, VA 23219
(804) 786-7951

If either of these agencies determines that your project may impact a Federally listed, proposed, or candidate species OR Federally designated critical habitat, please contact this office and provide a copy of the response letter from each agency and the above referenced project number; otherwise, further contact with this office is not necessary.

If you have any questions or need further assistance, please contact Ms. Jolie Harrison at (804) 693-6694, extension 208.

Sincerely,

Karen L. Mayne

Karen L. Mayne
Supervisor
Virginia Field Office

Enclosures

KEY

LE - federally listed endangered.

LT - federally listed threatened.

PE - federally proposed endangered.

PT - federally proposed threatened.

EX - believed to be extirpated in Virginia.

LE(S/A) - federally listed endangered due to similarity of appearance to a federally listed species.

LT(S/A) - federally listed threatened due to similarity of appearance to a federally listed species.

C - candidate species; the U.S. Fish and Wildlife Service has enough information to list the species as threatened or endangered, but this action is precluded by other listing activities.

SOC - species of concern; those species that have been identified as potentially imperiled or vulnerable throughout their range or a portion of their range. These species are not protected under the Endangered Species Act.

G - global rank; the species rarity throughout its total range.

G1 - extremely rare and critically imperiled with 5 or fewer occurrences or very few remaining individuals; or because of some factor(s) making it especially vulnerable to extinction.

G2 - very rare and imperiled with 6 to 20 occurrences or few remaining individuals; or because of some factor(s) making it vulnerable to extinction.

G3 - either very rare and local throughout its range or found locally (abundantly at some of its locations) in a restricted range; or vulnerable to extinction because of other factors. Usually fewer than 100 occurrences are documented.

G_T_ - signifies the rank of a subspecies or variety. For example, a G3T1 would apply to a subspecies of a species that is very rare and local throughout its range or found locally in a restricted range (G3) but the subspecies warrants a rank of T1, critically imperiled.

G_Q - The taxon has a questionable taxonomic assignment.

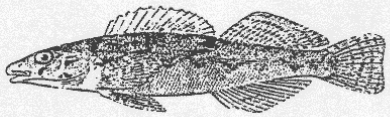
Roanoke Logperch



D.S. Jordan

Percina rex

Description - The Roanoke logperch is found only in the Roanoke, Nottoway, and Meherrin River systems of Virginia. This small fish can grow up to 4.5 inches in length. Its back is dark green and its sides are greenish to yellowish, both with dark markings; the belly is white to yellowish.

Life History - The logperch typically inhabits medium-to-large, warm, usually clear streams and small rivers of moderate to low gradient. It avoids moderately and heavily silted areas except during winter periods of inactivity. Winter habitat appears to be deep pools under boulders. During warm and mild months, adults usually inhabit the main body of stream pools, runs, and riffles and typically associate with gravel and rubble. Young are usually found in slow runs and pools with clean sandy bottoms. They are rarely found in impoundments. Spawning occurs in April or May in deep runs over gravel and small cobble and logperch typically bury their eggs with no subsequent parental care. This species commonly lives five to six years.

U.S. Fish and Wildlife Service
Virginia Field Office

http://www.fws.gov
August 1999

Logperch actively feed during the warmer months by flipping over stones with their snout and ingesting the exposed prey that consists of bottom-dwelling insects.

Conservation - The Roanoke logperch was listed as an endangered species on August 18, 1989. It appears that massive habitat loss associated with the construction of the large impoundments of the Roanoke River Basin in the 1950s and 1960s (Roanoke Rapids, Gaston, Kerr, Leesville, Smith Mountain, and Philpott Reservoirs) was the original cause of significant population declines of this species. These reservoir systems resulted in major disruptions in the ability of this species to move throughout its historic range. This species presently occurs in five populations in widely separated segments of the upper Roanoke, Pigg, Smith, Nottoway, and Meherrin Rivers. The populations in the Roanoke and Nottoway basins probably represent remnants of much larger populations that once occupied much of the Roanoke and Nottoway River drainage upstream of the fall line. All the populations are small and no genetic exchange occurs among them because they are separated by large impoundments and wide river gaps. Each population is vulnerable because of its relatively low density and limited range. Current threats are nonpoint source pollution and spills and accidents associated with chemical releases and destruction and degradation of habitat. Small logperch populations could go extinct with minor habitat degradation. Water withdrawals may pose a serious threat to the species in the future as the human population of the Roanoke River basin increases.

What You Can Do To Help - If you own property that borders a stream or other waterway, avoid using chemicals or fertilizers. To help control erosion and reduce runoff, maintain a buffer of natural vegetation along the stream bank. Install fencing to prevent livestock from entering the stream, this will reduce siltation and input of waste products.

To find out more about the Roanoke logperch contact:

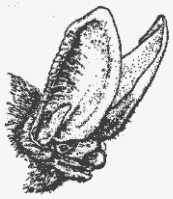
Virginia Big-Eared Bat

Corynorhinus townsendii virginianus



J.B. Schulz

Description - The Virginia big-eared bat is only known from a few caves in east-central Kentucky, western North Carolina, western Virginia, and northeastern West Virginia. This medium-sized bat has huge ears, weighs less than 0.5 ounces and is four inches in length from head to toe. It has long brown fur with pale brown underparts.

Life History - The Virginia big-eared bat lives in caves year-round at elevations greater than 1,500 feet above sea level. Although a colony may occupy the same cave throughout the year, it may have one or more roosts in other caves. Individuals move to other roosts even in cold weather. After mating in the fall and winter, the bats search for caves for hibernation. During hibernation males and females hibernate together in cool, well-ventilated portions of caves. These caves are typically located in regions dominated by oak-hickory or beech-maple-hemlock forests. Females congregate in a few maternity caves in summer. Females arrive pregnant and have one young per pregnancy. Young are born around mid-June, and by mid-July they begin to leave the cave at night to forage. Most bats leave the maternity cave by late September. Males are found in caves in summer, scattered singly and in larger numbers. The Virginia big-eared bat feeds mainly on moths.

Conservation - The Virginia big-eared bat was federally listed as an endangered species on November 30, 1979. These bats have declined primarily due to human disturbance and loss of habitat. This species is easily disturbed by human activity including vandalism, caving, and frequent visitation. These disturbances can cause adults to abandon caves, abandon their young, and force them to use valuable energy reserves needed to survive while in hibernation.

What You Can Do To Help - Avoid using pesticides and other chemicals near caves and waterways. Do not enter gated caves or mines. These gates have been installed to protect bats and human safety. Cave habitats are fragile and easily disturbed; if you must enter a cave, do so only as an observer and leave everything as you found it. Never shoot, poison, or otherwise harm bats. Bats are extremely beneficial insect eaters, and nuisance bats can be encouraged to move elsewhere. If you find a bat, please do not disturb it!

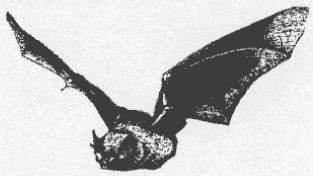
Indiana Bat

Myotis sodalis



Description - The Indiana bat occurs throughout 27 states in the eastern and mid-western U.S. It is found in the western portion of Virginia during hibernation, but seldom found in Virginia during the summer. This medium-sized bat weighs six to nine grams and has an average life span of four years. This short-eared bat is two inches from head to toe and has a wing span of nine to eleven inches. Its fur is dull grayish-brown and the underparts are pinkish.

Life History - After mating in the fall, the Indiana bat travels up to 300 miles to hibernate in large caves and abandoned mines that have stable, cold temperatures during the winter. The fact that the Indiana bats congregate and form large aggregations in only a small percentage of known caves suggests that very few caves meet their requirements. During hibernation they can be found on flat ceilings of caves in clusters containing 500 to 1,000 or more bats. Half of all hibernating Indiana bats winter in Indiana. Hibernation begins in mid-October and ends in April; females are the first to leave. Males roost in caves or mines during the summer. Maternity colonies are located in riparian forests along streams. Females roost together in hollow trees or under loose bark and have one young per pregnancy. The young are born in late June or early July. After one month, young are capable of flight and begin independent feeding. Foraging takes place along forested streams. They feed exclusively on insects.

Conservation - The Indiana bat was federally listed as an endangered species on March 11, 1967. This bat has declined primarily due to human disturbance during hibernation. This species is easily disturbed by human activity such as vandalism, caving, and research during the hibernating months. Other threats are flooding of caves, blockage of cave entrances, and pesticide poisoning.

What You Can Do To Help - Avoid using pesticides and other chemicals near caves and waterways. Do not enter gated caves or mines. These gates have been installed to protect bats and human safety. Cave habitats are fragile and easily disturbed; if you must enter a cave, do so only as an observer and leave everything as you found it. Never shoot, poison, or otherwise harm bats. Bats are extremely beneficial insect eaters, and nuisance bats can be encouraged to move elsewhere. If you find a bat, please do not disturb it!

Smooth Coneflower

Echinacea laevigata

L.W. Zettler

Description - The smooth coneflower occurs in Virginia, North Carolina, South Carolina, and Georgia. It no longer occurs in Pennsylvania. The smooth coneflower is a perennial herb with a single stem that grows up 59 inches in height. Stems are smooth with few leaves. The largest leaves are the elliptical leaves at the base of the plant which can reach a length of 7.8 inches. The petals of the flowers are light pink to purplish, usually drooping, and 1.9 to 3.1 inches in length. Flower heads are usually solitary.

Life History -This rare coneflower was formerly a plant of prairie-like habitats or oak savannahs maintained by fire and large herbivores such as elk and bison. Now, it is found in relatively open areas including dry woods, power line right-of-ways, dry limestone bluffs, roadsides, meadows, and clearcuts. Sites with bare soils rich in magnesium and/or calcium, abundant sunlight, and little competition from other plants are optimal. Flowering occurs from May through July.

Conservation - The smooth coneflower was federally listed as an endangered species on October 8, 1992. Currently, fire or some other suitable form of disturbance, such as well-timed mowing or the careful clearing of trees, is essential to maintaining the habitat remnants upon which this species depends. Loss of open habitat due to conversion to agriculture, silviculture, urbanization, and industrial development, as well as suppression of natural disturbances, such as fire, are a significant threat to this species. Other threats to this species include unauthorized collection, woody plant invasion, residential and industrial development, highway construction and improvement, herbicides, and roadside and power line right-of-way maintenance.

What You Can Do To Help - If you find a plant that appears to be the smooth coneflower, take note of the location and photograph the plant, if possible. Please do not remove the plant! Contact one of the following agencies for assistance:

APPENDIX G

ANALYTICAL DATA EVALUATION

THIS PAGE LEFT INTENTIONALLY BLANK

APPENDIX G.1

DATA QUALITY OBJECTIVES

THIS PAGE LEFT INTENTIONALLY BLANK

TABLE G.1-1
DATA USABILITY WORKSHEET
SITE: SWMUs 40 and 71
MEDIUM: Soil

Activity	Comment
Field Sampling	
Discuss sampling problems and field conditions that affect data usability.	There were no problems identified during field sampling that affected data usability.
Are samples representative of receptor exposure for this medium (e.g., sample depth, grab vs. composite, filtered vs. unfiltered, low flow, etc.)?	Yes. Samples are representative of receptor exposure. Surface soil samples and subsurface soil samples were collected from discrete intervals.
Assess the effect of field QC results on data usability.	Field duplicate samples were collected at the rate of 1 per 10 soil samples. The average concentration of the soil sample and its duplicate sample were used in the risk assessments. Equipment rinsate blank samples were collected at the rate of 1 per 20 soil samples. Low-level detections at concentrations below the laboratory reporting limit were reported in one or more of the equipment blank samples for selected metals, dioxins, and common laboratory contaminant bis(2-ethylhexyl)phlalate. No significant impact on data usability resulted from these detections. Matrix spike (MS)/matrix spike duplicate (MSD) samples were at the rate of 1 per 20 soil samples. No significant impact on data usability was identified based on the matrix spike results.
Summarize the effect of field sampling issues on the risk assessment, if applicable.	No significant sampling issues were noted. See Sections 6 and 7 of the RFI/CMS Report discuss the uncertainty analysis for the human health and ecological risk assessments for sampling and analysis.
Analytical Techniques	
Were the analytical methods appropriate for quantitative risk assessment?	Yes. Low-level SW-846 analytical methods were used for soil analysis in accordance with the MWP and WPA No. 013. Soil samples were analyzed for SVOCs by SW-846 Method 8270C, PAHs by SW-846 Method 8310, explosives by SW-846 Methods 8330 and 8332, pesticides by SW-846 Method 8081A, PCBs by SW-846 Method 8082, PCB congeners by EPA Method 1668, dioxin/furans by SW-846 Method 8290, and metals by SW-846 6010B, 6020, and 7471A.
Were detection limits adequate?	Low-level SW-846 Methods were used. The detection limits were adequate for screening against adjusted RBCs with the except as noted in Tables E.2-2.3 and E.2-2.3. As discussed in the uncertainties in Sections 6 and 7, the lack of sensitivity could lead to an underestimation of risk

TABLE G.1-1
DATA USABILITY WORKSHEET
SITE: SWMUs 40 and 71
MEDIUM: Soil

Activity	Comment
	at the site.
Summarize the effect of analytical technique issues on risk assessment, if applicable.	There were no analytical technical issues, which significantly affected the risk assessments. Sections 6 and 7 of the RFI/CMS Report discuss the uncertainty analysis for the human health and ecological risk assessments for sampling and analysis.
Data Quality Objectives	
Precision – How were duplicates handled?	Field duplicate samples were collected at the rate of 1 per 10 soil samples. The average concentration of the soil sample and its duplicate sample were used in the risk assessments.
Accuracy – How were split samples handled?	Split samples were not collected.
Representativeness – Indicate any problems associated with data representativeness (e.g., trip blank or rinsate blank contamination, COC problems, etc.).	No significant issues regarding data representativeness were noted.
Completeness – Indicate any problems associated with data completeness (e.g., incorrect sample analysis, incomplete sample records, problems with field procedures, etc.).	No significant issues regarding completeness of the data were noted. The overall completeness goal of 90$\pm$2% for field activities was exceeded for analytical analysis and field data collection.
Comparability – Indicate any problems associated with data comparability.	No significant issues regarding comparability of the data were noted.
Were the DQOs specified in the QAPP satisfied?	Yes, the DQOs specified in the QAPP were satisfied with the exception of the major anomalies identified for thallium and 1,3,5-trinitrobenzene which resulted in the R-flagging of approximately 40% of the QA/QC data in a data usability of 60% for these compounds.
Summarize the effect of DQO issues on the risk assessment, if applicable.	Not applicable
Data Validation and Interpretation	
What are the data validation requirements for this region?	EPA Region III modifications to the National Functional Guidelines for Data Validation.
What method or guidance was used to validate the data?	EPA Region III National Functional Guidelines for Data Validation.
Was the data validation method consistent with regional guidance? Discuss any discrepancies.	Yes, there were no discrepancies.
Were all data qualifiers defined? Discuss those which were not.	Yes, they were defined in the guidance document, data validation reports included in Appendix G of the RFI/CMS Report, and in the data tables included

TABLE G.1-1
DATA USABILITY WORKSHEET
SITE: SWMUs 40 and 71
MEDIUM: Soil

Activity	Comment
	in Section 4.0 of the RFI/CMS Report.
Which qualifiers represent usable data?	B, E, J, K, L, UJ, UL
Which qualifiers represent unusable data?	R
How are tentatively identified compounds handled?	Detected tentatively identified compounds are qualified NJ. These compounds are not used in the risk assessments.
Summarize the effect of data validation and interpretation issues on the risk assessment, if applicable.	Section 6 of the RFI/CMS Report discusses uncertainties associated with qualified data.
Additional notes:	None.

Notes:
EQB = Equipment Blank
TAL = Target Analyte List
TCL = Target Compound List
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
PAH = Polynuclear Aromatic Hydrocarbon
MDL = Method Detection Limit
RL = Reporting Limit
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = reason code

Qualifiers:
B = Not detected substantially above the level reported in laboratory or field blanks.
D = Diluted sample.
J = Analyte present. Reported value may not be accurate or precise.
K = Analyte present. Reported value may be biased high. Actual value is expected to be lower.
L = Analyte present. Reported value may be biased low. Actual value is expected to be higher.
P = Greater than 40% difference for detected concentrations between the two GC or HPLC columns.
U = The compound was analyzed for but not detected.
UJ = Not detected, quantitation limit may be inaccurate or imprecise.
UL = Not detected, quantitation limit is probably higher.
c = Calibration failure; poor (RRF) or unstable (%D) response
o = Calibration blank contamination
p = Preparation blank contamination
w = Laboratory storage blank contamination
z = Method blank and/or storage blank contamination

TABLE G.1-2
DATA USABILITY WORKSHEET
SITE: SWMUs 40 and 71
MEDIUM: Groundwater

Activity	Comment
Field Sampling	
Discuss sampling problems and field conditions that affect data usability.	There were no problems identified during field sampling that affected data usability.
Are samples representative of receptor exposure for this medium (e.g., sample depth, grab vs. composite, filtered vs. unfiltered, low flow, etc.)?	Yes. Both filtered and unfiltered samples were collected for metals. Filtered metals samples were used in the risk assessment and are considered representative of dissolved concentrations in groundwater. Low-flow groundwater sampling techniques were used to collect the samples representative of groundwater quality.
Assess the effect of field QC results on data usability.	Field duplicate samples were collected at the rate of 1 per 10 groundwater samples. The average concentration of the groundwater sample and its duplicate sample were used in the risk assessments. Equipment rinsate blank samples were collected at the rate of 1 per 20 groundwater samples. Low-level detections at concentrations below the laboratory reporting limit were reported in one or more of the equipment blank samples for selected metals and in one equipment blank sample for dioxins. No significant impact on data usability resulted from these detections. Matrix spike (MS)/matrix spike duplicate (MSD) samples were at the rate of 1 per 20 groundwater samples. No significant impact on data usability was identified based on the matrix spike results.
Summarize the effect of field sampling issues on the risk assessment, if applicable.	No significant sampling issues were noted. See Sections 6 of the RFI/CMS Report discuss the uncertainty analysis for the human health risk assessment for sampling and analysis.
Analytical Techniques	
Were the analytical methods appropriate for quantitative risk assessment?	Yes. Low-level SW-846 and EPA analytical methods were used for groundwater analysis in accordance with the MWP and WPA No. 013. Groundwater samples were analyzed for SVOCs by SW-846 Method 8270C, PAHs by SW-846 Method 8310, explosives by SW-846 Methods 8330 and 8332, pesticides by SW-846 Method 8081A, PCBs by SW-846 Method 8082, dioxin/furans by SW-846 Method 8290, and metals by SW-846 6010B, 6020, and 7470A, and perchlorate by Method EPA 314 (prior to 2007) and SW-846 Method 6850 (2007).

TABLE G.1-2
DATA USABILITY WORKSHEET
SITE: SWMUs 40 and 71
MEDIUM: Groundwater

Activity	Comment
Were detection limits adequate?	Yes. Low-level SW-846 Methods were used. The detection limits were adequate for screening against adjusted RBCs except as noted in Tables E.1-2.5 and E.2-2.5. As discussed in the uncertainties in Section 6, the lack of sensitivity could lead to an underestimation of risk at the site.
Summarize the effect of analytical technique issues on risk assessment, if applicable.	There were no analytical technical issues, which significantly affected the risk assessments. Section 6 of the RFI/CMS Report discusses the uncertainty analysis for the human health for sampling and analysis.
Data Quality Objectives	
Precision – How were duplicates handled?	Field duplicate samples were collected at the rate of 1 per 10 groundwater samples. The average concentration of the groundwater sample and its duplicate sample were used in the risk assessment.
Accuracy – How were split samples handled?	Split samples were not collected.
Representativeness – Indicate any problems associated with data representativeness (e.g., trip blank or rinsate blank contamination, COC problems, etc.).	No significant issues regarding data representativeness were noted.
Completeness – Indicate any problems associated with data completeness (e.g., incorrect sample analysis, incomplete sample records, problems with field procedures, etc.).	No significant issues regarding completeness of the data were noted. The overall completeness goal of 90$\pm$2% for field activities was exceeded for analytical analysis and field data collection.
Comparability – Indicate any problems associated with data comparability.	No significant issues regarding comparability of the data were noted.
Were the DQOs specified in the QAPP satisfied?	Yes, the DQOs specified in the QAPP were satisfied.
Summarize the effect of DQO issues on the risk assessment, if applicable.	Not applicable
Data Validation and Interpretation	
What are the data validation requirements for this region?	EPA Region III modifications to the National Functional Guidelines for Data Validation.
What method or guidance was used to validate the data?	EPA Region III National Functional Guidelines for Data Validation.
Was the data validation method consistent with regional guidance? Discuss any discrepancies.	Yes, there were no discrepancies.

TABLE G.1-2
DATA USABILITY WORKSHEET
SITE: SWMUs 40 and 71
MEDIUM: Groundwater

Activity	Comment
Were all data qualifiers defined? Discuss those which were not.	Yes, they were defined in the guidance document, data validation reports included in Appendix H of the RFI/CMS Report, and in the data tables included in Section 4 of the RFI/CMS Report.
Which qualifiers represent usable data?	B, J, JB, U
Which qualifiers represent unusable data?	R
How are tentatively identified compounds handled?	Detected tentatively identified compounds are qualified NJ. These compounds are not used in the risk assessment.
Summarize the effect of data validation and interpretation issues on the risk assessment, if applicable.	Section 6 of the RFI/CMS Report discusses uncertainties associated with qualified data.
Additional notes:	None.

DATA VALIDATION REPORT - Level III Review

SDG No.: _____Q2788_____ **Fraction:**_VOCs, SVOCs, Pest., PCBs, PAH,___ __Explosives, Nitroglycerin, Metals___

Lab: _CompuChem_____ **Project Name:** __Radford SWMU 40/71_____

Reviewer: _____RA, AJ_____ **Date:** _____February 10, 2003_____

This report presents the findings of a review of the referenced data. The report consists of this summary, copies of data reports with data qualifying flags applied (as required), the completed data validation checklist, supporting documentation, and an explanation of the data qualifying flags employed. The review performed is based on the USEPA Region III Modifications to the National Functional Guidelines for Organic and Inorganic Data Review as pertains to the specifics of the analytical methods employed and provisions of the approved project-specific QAPP.

Major Anomalies: For the VOC analyses, severe loss of internal standards was observed in samples 40SS4 and D-1. All results were flagged "R,i" in these samples. These samples were re-analyzed with acceptable recoveries and results from the re-analyses should be used for these samples.

Minor Anomalies: For the VOC analyses, the method blank analyzed on 11/24/02 contained acetone at 1 ug/Kg, dichlorodifluoromethane at 0.5 ug/Kg, toluene at 0.7 ug/Kg, 1,4-dichlorobenzene at 0.3 ug/Kg, 1,2-dichlorobenzne at 0.3 ug/Kg, and 1,2,4-trichlorobenzene at 0.4 ug/Kg. The method blank analyzed on 11/25/02 contained trichlorofluoromethane at 3 ug/Kg, acetone at 15 ug/Kg, methylene chloride at 3 ug/Kg, and toluene at 1 ug/Kg. The method blank analyzed on 11/26/02 contained toluene at 1 ug/Kg. The method blank analyzed on 11/27/02 contained toluene at 1 ug/Kg. Positive results less than 10 times the blank concentration were flagged "B,z" for acetone and methylene chloride in the associated samples. Positive results less than 5 times the blank concentration were flagged "B,z" for the other compounds in the associated samples. The method blank also contained positive TIC results. Positive results reported in the associated field samples were manually crossed out on the result forms by the reviewer in the associated samples. The trip and equipment blanks were located in SDG R2788. These blanks contained positive results for toluene, acetone, 2-butanone and methylene chloride. Positive methylene chloride, acetone and 2-butanone results less than 10 times the blank concentration were flagged "B,x" in the associated samples. Positive toluene results less than 5 times the blank concentration were flagged "B,x" or "B,y" in the associated samples unless previously flagged due to other anomalies.

The CCV analyzed on 11/27/02 at 1017 displayed a %D greater than the control limit (i.e., 20%) with a negative bias for bromomethane at 21.4%. Non-detects were flagged "UJ,c" in the associated samples.

The recoveries for three surrogates were greater than the upper QC limit in samples 40SB9CRE and 40SB8F. The recoveries for surrogates toluene-d8 and 4-bromofluorobenzene were greater than the upper QC limit in samples D-1, 40SS4RE and 40SS5. Positive results were flagged "K,s" in these samples. The recoveries for surrogate toluene-d8 were greater than the QC limit in samples 40SS4, 40SS3, and 40SB11C. The recoveries for surrogate bromofluorobenzene were greater than the upper QC limit in samples s 40SS5RE and 40SS3RE. The recoveries for surrogate 1,2-dichloroethane were greater than the upper QC limit in sample 40SB9FRE and less than the lower QC limit in sample 40SB8FRE. Positive results were flagged "J,s" and non-detects were flagged "UJ,s" in these samples.

The MS/MSD recoveries for bromomethane (15%/17%), acetone (360%/380%), 2-butanone (350%/410%), 4-methyl-2-pentanone (320%/370%), 2-hexanone (320%/380%), 1,1,2,2-tetrachloroethane (180%/190%), 1,2-dibromo-3-chloropropane (180%/210%), methyl acetate (190%/200%), the MSD recovery for chloroethane (17%), and the %RPDs for all compounds except acetone, dichlorodifluoromethane, vinyl chloride, trichlorofluoromethane, chloroethane, tetrachloroethene, and xylene were outside the QC limit. Non-detects were flagged "UJ,m" and positive results were flagged "J,m" for the other compounds in the parent sample 40SB9C.

The recoveries for internal standards chlorobenzene-d5 and 1,4-dichlorobenzene were less than the lower QC limit in samples 40SS$, 40SS5, 40SS2, 40SS5RE, and 40SB8FRE. Positive associated results were flagged "J,i" and non-detects were flagged "UJ,i" unless previously flagged due to other anomalies. The original sample result should be used for sample 40SB8F and the re-analysis results should be used for sample 40SS2 since they displayed better internal standard recoveries. The recoveries for internal standard 1,4-dichlorobenzene were less than the lower QC limit in samples 71SS11, 40SS3, 40SS1, 40SB11F, 40SB11B, 40SB11C, 40SB9F, 40SB9C, D-1RE, 40SS4RE, 71SS11RE, 40SS3RE, 40SS2RE, 40SS1RE, 40SB11FRE, 40SB11BRE, 40SB11CRE, 40SB9CRE, and 40SB8F. Positive associated results were flagged "J,i" and non-detects were flagged "UJ,i" unless previously flagged due to other anomalies. The original sample results should be used for samples 71SS11, 40SS3, 40SS1, 40SB11F, 40SB11B, 40SB9F, 40SB9C, and 40SB8F and the re-analyses results should be used for samples D-1RE, 40SS4RE, 40SS5RE, 40SS2RE, and 40SB11CRE since they displayed better internal standard recoveries.

For the SVOC analyses, equipment blanks located in SDG R2788 contained caprolactam at 21 ug/L and 22 ug/L. Positive results were greater than 5 times the blank concentration and no data qualifying action was required. The method blanks contained positive TIC results. Positive results reported in the associated field samples were manually crossed out on the result forms by the reviewer in the associated samples.

The initial calibration analyzed on 11/7/02 displayed %RSDs greater than the control limit (i.e., 15%) for benzaldehyde at 17.8%, bis (2-chloroethyl)ether at 17.88%, 4-methylphenol at 21.06%, 2,4,5-trichlorophenol at 15.23%, 2,2-oxybis(1-chloropropane) at 28.3%, n-nitroso-di-n-propylamine at 17.5%, hexachloroethane at 17.7%, naphthalene at 15.3%, 4-chlroro-3-methylphenol at 15.3%, 2-methyl naphthalene at 16.1%, dimethylphthalate at 15.8%, acenapthylene at 22.3%, acenaphthene at 24.4%, dibenzofuran at 20.9%, fluorene at 18.6%, 4,6-dinitro-2-methylphenol at 17.3%, n-nitrosodiphenylamine at 24.9%, 4-bromophenyl-phenylether at 15.8%, atrazine at 57.9%, pentachlorophenol at 15.9%, phenanthrene at 16.2%, anthracene at 15.7%, carbazole at 15.5%, 3,3-dichlorobenzidine at 16.4%, chrysene at 16.5%, benzo(k)fluoranthene at 23.6%, and dibenzo(a,h)anthracene at 16.9%. Non-detects were flagged "UJ,r" for atrazine since the failure was serious enough (i.e., > 50%) to affect the non-detects. Positive results were flagged "J,r" for the other compounds in the associated samples.

The CCV analyzed on 11/14/02 at 1015 displayed a %D greater than the control limit (i.e., 20%) with a positive bias for hexachlorocyclopentadiene at 40.86% and with a negative bias for atrazine at 33.4%. No positive results were reported for hexachlorocyclopentadiene and no data qualifying action was required. Atrazine results were previously flagged due to initial calibration failure and no further data qualifying action was required.

The CCV analyzed on 11/18/02 at 2139 displayed %Ds greater than the control limit with a negative bias for atrazine at 44.55%, phenanthrene at 20.51%, and di-n-butylphthalate at 22.51%. Positive results were flagged "J,c" and non-detects were flagged "UJ,c" unless previously flagged due to other anomalies.

The CCV analyzed on 11/19/02 at 0949 displayed %Ds greater than the control limit with a negative bias for atrazine at 24.79%, and with a positive bias for 3,3-dichlorobenzidine at 25.2% and benzo(b)fluoranthene at 20.67%. All associated sample results were non-detects for 3,3-dichlorobenzidine and benzo(b)fluoranthene or were previously flagged and no further data qualifying action was required.

The CCV analyzed on 11/24/02 at 1004 displayed %Ds greater than the control limit with a negative bias for benzaldehyde at 20.12%, 2,2-oxybis(1-chloropropane) at 21.79%, caprolactam at 23.8%, 4-nitroaniline at 23.56%, atrazine at 53.53%, and with a positive bias for hexachlorobenzene at 23.25%. Non-detects were flagged "UJ,c" for failures with a negative bias unless previously flagged due to other anomalies. No positive results were reported for hexachlorobenzene and no data qualifying action was required.

The MS/MSD pair for sample 40SB9C displayed recoveries for 2-chlorophenol (130%/120%), 4-chloro-3-methylphenol (140%/140%), the MS recoveries for phenol (130%) and 2,4-dichlorophenol (130%), and the %RPD for benzaldehyde (58%) and 2,4-dinitrophenol (60%) were greater than the upper QC limits. No positive results were reported for these compounds in the parent sample, 40SB9C, and no data qualifying action was taken.

The LCS recoveries were greater than the upper QC limits for phenol (142%), 2-chlorophenol (146%), 2-nitrophenol (143%/135%), 2,4-dimethylphenol (148%/158%), 2,4-dichlorophenol (142%/144%), 4-chloro-3-methylphenol (140%/160%), 2,4,6-trichlorophenol (150%), 4-nitroaniline (116%), and pantachlorophenol (176%/172%). No positive results were reported for these compounds and no data qualifying action was required.

For the pesticides analyses, the CCV analyzed on 11/14/02 at 1546 displayed %Ds greater than the control limit (i.e., 15%) with a positive bias for 4,4-DDT at 21.88% and methoxychlor at 19.24%. No positive results were reported for these compounds in the associated samples and no data qualifying action was taken.

For the pesticides/PCB analyses, the CCV analyzed on 11/14/02 at 2252 displayed %Ds greater than the control limit with a negative bias for 4,4-DDE at 16.39%, 4,4-DDT at 18.49%, and aroclor-1260 at 16.5%. All associated sample results were non-detects and were flagged "UJ,c".

For the pesticides analyses, the CCV analyzed on 11/25/02 at 2131 displayed a %D greater than the control limit with a positive bias for 4,4-DDD at 16.98%. No positive results were reported in the associated samples and no data qualifying action was taken.

The recoveries for surrogate decachlorobiphenyl were greater than the upper control limit in samples S0SB12A (560%) and 40SS4 (161%). No action is required based on one surrogate failure and no data flags were applied. The recoveries for surrogates decachlorobiphenyl (38%) and tetrachloro-m-xylene (40%/40%) were less than the lower control limits in sample 40SS2. Positive results were flagged "L,s" and non-detects were flagged "UL,s." This sample was

re-analyzed with acceptable surrogate recoveries. Results from the re-analyses should be used for data interpretation purposes.

The RPDs between the two columns were greater than the QC limit (i.e., 40%) for several compounds in several samples. These results were flagged "J,g".

For the PAH analyses, the CCV analyzed on 11/15/02 at 1252 displayed %Ds greater than the control limit (i.e., 15%) with a positive bias for phenanthrene at 15.56% and fluoranthene at 18.26%. The CCV analyzed on 11/18/02 at 1117 displayed a %D greater than the control limit with a positive bias for acenaphthylene at 16.17%. The CCV analyzed on 11/19/02 at 0426 displayed %Ds greater than the control limit with a positive bias for pyrene at 16.48% benzo(b)fluoranthene at 15.34%, and acenaphthylene at 18.63%. The CCV analyzed on 11/21/02 at 0059 displayed %Ds greater than the control limit with a positive bias for fluorene at 16.88% and benzo(g,h,i)perylene at 15.39%. The CCV analyzed on 11/21/02 at 0735 displayed %Ds greater than the control limit with a positive bias for benzo(g,h,i)perylene at 18.08% and acenaphthylene at 15.39. Positive results were flagged "J,c" in the associated samples.

The surrogate recoveries for p-terphenyl were greater than the upper QC limit in samples 40SS1, 40SS4, 40SS2, 40SB11F, 40SB9F and 40SB8F. Positive results were flagged "K,s" in the these samples.

The MS/MSD recoveries for chrysene (-953%/-930%) and the %RPD for acenaphthene (60%) were outside the QC limit. This could be due to sample matrix interference. No data flags were applied to the chrysene result since the sample concentration was greater than 4 times the spiking amount. No data flags were applied to the acenaphthene result since the MS/MSD recoveries were acceptable.

The RPDs between the two columns were greater than the QC limit (i.e., 40%) for several compounds in several samples. These results were flagged "J,g" unless previously flagged due to other anomalies.

For the explosive analyses, the continuing calibration analyzed on 11/20/02 at 1155 displayed %Ds greater than the QC limit (i.e., 15%) with a positive bias for 1,3-dinitrobenzene at 17.06%, 2,4,6-trinitrotoluene at 16.04%, and 4-amino-2,6-dinitrotoluene at 17.29%. The continuing calibration analyzed on 11/21/02 at 0714 displayed %Ds greater than the QC limit with a positive bias for 1,3-dinitrobenzene at 16.04% and 4-amino-2,6-dinitrotoluene at 19.04%. No positive results were reported no data qualifying action was required. The continuing calibration analyzed on 11/21/02 at 1439 displayed %Ds greater than the QC limit with a negative bias for 2,4,6-trinitrotoluene at 19.32% and with a positive bias for 4-nitrotoluene at 18.71%. Non-detects were flagged "UJ,c" for 2,4,6-

trinitrotoluene in the associated samples. No positive results were reported for 4-nitrotoluene in the associated samples and no data qualifying action was taken.

The MS/MSD recoveries for nitrobenzene (43%/39%) were less than the lower QC limit (i.e., 50%). The %RPD for RDX (44%) was greater than the QC limit (i.e., 30%). The nitrobenzene non-detect was flagged "UJ,m" in the parent sample 40SB9C.

For the metal analyses, the initial CRDL percent recoveries for calcium (89%), copper (87.6%), lead (73%), potassium (68.8%), silver (113%), thallium (110.5%) and zinc (70.1%) were outside the control limit (i.e., 90-110%). Positive results less than 2xCRDL were flagged "L,w" and non-detects were flagged "UL,w" for potassium and zinc in the associated samples. Positive silver and thallium results less than 2xCRDL were flagged "K,w" in the associated samples. Positive results for the other analytes were greater than 2xCRDL and no data qualifying action was required.

The method blanks contained negative results for calcium and zinc. All associated sample results were positive and were flagged "L,p" unless previously flagged due to other anomalies. The equipment blanks located in SDG R2788 contained barium and sodium at low concentrations. Positive sodium results less than 5 times the blank concentration were flagged "B,x" in the associated samples. Positive barium results were greater than 5 times the blank concentration and no data qualifying action was required. The initial and continuing calibration blanks also contained positive results for antimony, magnesium, manganese and negative results for calcium and zinc. All associated sample results were either greater than 5 times the blank concentration or were previously flagged. No further data qualifying action was required.

The MS/MSD recoveries for antimony (34.2%/36%), selenium (62.9%/72.9%), lead (210.8%/237.9%), thallium (48.2%/48.2%), manganese (51.5%/179.6%) and the MSD recoveries for arsenic (227%) and copper (125.4%) were outside the control limit (i.e., 75-125%). Positive results were flagged "L,m" and non-detects were flagged "UL,m" for antimony, selenium and thallium. Positive results were flagged "K,m" for lead, arsenic, manganese and copper unless previously flagged due to other anomalies.

The serial dilution %D for potassium (16.1%) was greater than the QC limit (i.e., 10%). Positive results were flagged "J,s" unless previously flagged due to other anomalies.

Correctable Anomalies: It should be noted that sample 71SS11 appeared twice on the COC received 11/12/02 by the lab. Containers for collection at 1445 were labeled 71SB11. The lab was instructed to use the ID on the containers which was 71SB11.

Comments: Due to the abundance of target compounds, most of the samples were analyzed at dilutions for all organic analyses and some inorganic analyses. Therefore, the reporting limits were raised.

It should be noted that the positive TIC results were flagged "NJ,t" in the associated samples. Except for data flagged "R", all data as qualified, are usable for their intended purpose based on the data reviewed.

Samples 40SB8A and 40SB8F were received in a cooler that was chilled to 1.1 degrees C, below the 2.0 degrees QC limit. No data qualifying action was taken since the samples were not frozen.

Signed: Rangan
