Quality Control

Appendix A-1

Analytical Services and Procedures

ANALYTICAL SERVICES AND PROCEDURES

ANALYTICAL SERVICES

The analytical services for the field investigation program were provided by the following USACE and National Environmental Laboratory Accreditation Conference (NELAC) validated laboratories:

- Accutest Laboratories, Inc. (Accutest), Orlando, FL: Accutest used *USEPA Office of Soil Waste and Emergency Response Test Methods for Evaluating Soil Waste Physical and Chemical Methods, Update IIIB.* (SW-846) (USEPA, 2004) methodologies in providing analytical support for this investigation. Chemical analyses included: volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), polynuclear aromatic hydrocarbons (PAHs), metals, pesticides, polychlorinated biphenyls (PCBs), herbicides, explosives, full toxicity characteristic leaching procedure (TCLP) analysis, ignitability, reactive sulfide, reactive cyanide, and corrosivity as pH. Accutest used *USEPA Methods for Chemical Analysis of Water and Wastes* (MCAWW) (USEPA, 1983) for chemical oxygen demand (COD) and biological oxygen demand (BOD) analysis.
- Datachem Laboratories, Inc. (Datachem), Salt Lake City, UT: Datachem was subcontracted by Accutest to perform analytical support for perchlorates. Datachem used *USEPA Office of Soil Waste and Emergency Response Test Methods for Evaluating Soil Waste Physical and Chemical Methods, Update IIIB* (SW-846) (USEPA, 2004) methodologies for this analysis.
- SGS Environmental Services, Inc. (SGS), Wilmington, NC: SGS was subcontracted by Accutest to perform analytical support for dioxins/furans. SGS used *USEPA Office of Soil Waste and Emergency Response Test Methods for Evaluating Soil Waste Physical and Chemical Methods, Update IIIB* (SW-846) (USEPA, 2004) methodologies for this analysis.

ANALYTICAL PROCEDURES

Analytical protocols used were in accordance with USEPA-approved methods for the analysis of environmental (i.e., organic, and inorganic parameters) and waste characterization samples. All methods performed were within the *DoD Quality Systems Manual for Environmental Laboratories, Final Version 3* (DoD, 2006) and the *DoD Perchlorate Handbook* (DoD, 2006) guidelines. The methodologies for environmental samples are summarized in **Table A-1** and for waste characterization samples in **Table A-2**. A brief discussion of the methodologies is presented in the following sections below.

Organics

Target compound list (TCL) VOCs, TCL SVOCs, TCL pesticides, TCL PCBs, herbicides, explosives, including nitroglycerin (NG) and pentaerythritol tetranitrate (PETN), PAHs, and dioxins/furans were analyzed using USEPA-approved methodologies. The laboratory procedures and methodologies for organic compounds are summarized below.

Table A-1
Summary of Analytical Methods for Environmental Samples

Parameter	Matrix	Analytical Method
Chemical Parameters		
TCL VOCs	Aqueous	USEPA SW-846 5030B/8260B
	Soil	USEPA SW-846 5035/8260B
TCL SVOCs	Aqueous	USEPA SW-846 3510C/8270C
	Soil	USEPA SW-846 3550B/8270C
TCL Pesticides	Aqueous	USEPA SW-846 3510C/8081A
	Soil	USEPA SW-846 3550B/8081A
TCL PCBs	Aqueous	USEPA SW-846 3510C/8082
	Soil	USEPA SW-846 3550B/8082
Herbicides	Aqueous	USEPA SW-846 3510C/8151A
	Soil	USEPA SW-846 3550B/8151A
Explosives	Aqueous	USEPA SW-846 3535A/8330A Modified
	Soil	USEPA SW-846 8330B/8330A Modified
Nitroglycerin & PETN	Aqueous	USEPA SW-846 3535A/8332
	Soil	USEPA SW-846 8330B/8332
Polynuclear Aromatic Hydrocarbons	Aqueous	USEPA SW-846 3510C/8270C SIM
	Soil	USEPA SW-846 3550B/8270C SIM
Perchlorates	Aqueous	USEPA SW-846 LC-MS-CLO_4/6850 SIM
Dioxins/furans	Aqueous	USEPA SW-846 8290
	Soil	USEPA SW-846 8290
TAL Metals	Aqueous	USEPA SW-846 3010A/6010B & 7470A
	Soil	USEPA SW-846 3050B/6010B & 7471A

Corrosivity as pH	Aqueous	USEPA SW-846 9040C

TCL VOCs: Aqueous and solid samples were analyzed for TCL VOCs using USEPA SW-846 Method 5030B/8260B for aqueous samples and USEPA SW-846 5035/8260B for solid matrices using purge and trap technology. TCLP extracts were analyzed according to USEPA SW-846 Method 1311/5030B/8260B for investigative-derived material (IDM) solid samples. Soil samples were collected using field preservation techniques. Approximately 5 grams of soil sample was added to pre-tared vials containing methanol and/or de-ionized ultra filtered water (DIUF); then sent to the laboratory for analysis. Aqueous samples were sent to the laboratory in zero headspace vials. An inert gas was bubbled through a mixture of reagent water and 5 gram soil sample or through a 25 mL aqueous sample contained in a specifically designed purging chamber at 40°C for soil and ambient temperature for water. The vapor was swept through a sorbent column where the purgeable compounds were trapped. After purging was completed for both solid and aqueous samples, the sorbent column was heated and backflushed with the inert gas to desorb the purgeable compounds onto a gas chromatograph programmed to separate the purgeable compounds, which were then detected with a mass spectrometer. The gas chromatography/mass spectroscopy (GC/MS) instrument was calibrated for a series of target analytes using chemical standards of known concentration and purity. Quantification of these target analytes was performed against specific internal standards as identified in the respective method. Identification of these target analytes was based on a comparison of the analyte to the chemical standards used during calibration based on the analyte's retention time and mass spectra.

TCL SVOCs/PAHs: Aqueous and solid samples were analyzed for TCL SVOCs and PAHs using USEPA SW-846 Method 8270C. The use of selective ion monitoring (SIM) using USEPA SW-846 Method 8270C SIM was employed for PAH analysis to achieve lower quantitation and detection limits in order to meet screening criteria. Soil samples were extracted using ultrasonic extraction according to USEPA SW-846 Method 3550B and aqueous samples were extracted using a separatory funnel liquid-liquid extraction technique according to USEPA SW-846 Method 3510C. TCLP SVOC extracts were extracted using a separatory funnel liquid-liquid extraction technique according to USEPA SW-846 Method 1311/3510C for solid IDM samples. The extracts were injected into a gas chromatograph programmed to separate the compounds, which are then detected with a mass spectrometer. The gas chromatograph/mass spectrometer instrument was calibrated for a series of target analytes using chemical standards of known concentration and purity. Quantification of these target analytes was performed against specific internal standards as identified in the respective method. Identification of these target analytes was based on a comparison of the analyte to the chemical standards used during calibration based on the analyte's retention time and mass spectra.

TCL Pesticides/PCBs: Aqueous and solid samples were analyzed for TCL pesticides using USEPA SW-846 Method 8081A and for TCL PCBs using USEPA SW-846 Method 8082. Samples were prepared for analysis using extraction techniques. Soil samples were extracted using ultrasonic extraction according to USEPA SW-846 Method 3550B and aqueous samples were extracted using a separatory funnel liquid-liquid extraction technique according to USEPA SW-846 Method 3510C. TCLP pesticide extracts were extracted using a separatory funnel liquid-liquid extraction technique according to USEPA SW-846 Method 1311/3510C for solid IDM samples. The extracts were injected onto a gas chromatography programmed to separate the compounds, which are then detected with an electronic capture device (ECD). Sulfur cleanups were employed to aid in the quantification based upon the matrix interferences. Sample concentrations were confirmed on dissimilar columns.

Herbicides: Aqueous and solid samples were analyzed for herbicides according to USEPA SW-846 Method 8151A. Samples were prepared for analysis using extraction techniques. Soil samples were extracted using ultrasonic extraction according to USEPA SW-846 Method 3550B and aqueous samples were extracted using a separatory funnel liquid-liquid extraction technique according to USEPA SW-846 Method 3510C. TCLP herbicide extracts were extracted using a separatory funnel liquid-liquid extraction technique according to USEPA SW-846 Method 1311/3510C for solid IDM samples. Aqueous and solid samples were extracted with diethyl ether and then esterified with diazomethane. The derivatives were determined by gas chromatography with an electron capture detector (GC/ECD). The results were reported as acid equivalents. Sample concentrations were confirmed on dissimilar columns.

Explosives: Aqueous and solid (including IDM) samples were analyzed for explosives using USEPA SW-846 Method 8330A Modified. Aqueous samples were extracted using a Solid-phase Extraction (SPE) procedure USEPA SW-846 3535A. A measured volume of sample was adjusted to a specified pH and then extracted using a SPE device. Target analytes were eluted from the solid-phase media using methylene chloride. The resulting solvent extract was dried using sodium sulfate and concentrated. The concentrated extract were exchanged into a solvent compatible with subsequent cleanup procedures and then measurement of the target analytes separated on a C-18 reverse phase column. The wavelength was set at 254 nanometers and confirmed on a cyanide reverse column. For soil samples, they were homogenized and analyzed using USEPA SW-846 Method 8330B/8330A Modified. Because only a small 2-g portion (sub-sample) of the 10-g or larger sample was taken for analysis, the bulk sample was thoroughly mixed to allow for representative sub-sampling. This was achieved by air-drying at room temperature for 24 hours, sieving through a 30-mesh sieve, grinding, and mixing the bulk sample, after subjectively removing vegetation (organic debris) and pebbles. Soil samples were extracted using acetonitirile in an ultrasonic bath, then filtered and determined similarly to aqueous samples. Sample concentrations were confirmed on dissimilar columns.

Nitroglycerin/PETN: Aqueous and solid (including IDM) samples were analyzed for nitroglycerin and PETN using USEPA SW-846 Method 8332. For soil samples, they were homogenized and analyzed using USEPA SW-846 Method 8330B/8330A Modified. Solid samples were extracted with acetonitrile in an ultrasonic bath, then filtered and mixed with a calcium chloride solution. Aqueous samples were extracted using a Solid-phase Extraction (SPE) procedure USEPA SW-846 3535A, as described for explosives. The concentrations were quantified using an isocratic high pressure liquid chromatography (HPLC) system equipped with a column heater and ultraviolet (UV) detector. Sample concentrations were confirmed on dissimilar columns. Identification of these target analytes was based on a comparison of the analyte to the chemical standards used during calibration based on the analyte's retention time using primary and secondary columns.

Dioxins/Furans: Aqueous and solid samples were analyzed for dioxin/furans using USEPA SW-846 Method 8290. The analytical method used high-resolution gas chromatography and high-resolution mass spectrometry (HRGC/HRMS) on purified sample extracts. This method is specific for the analysis of 2,3,7,8-tetrachlorinated dibenzofuran (2,3,7,8-TCDD), substituted penta-, hexa-, hepta- and octachlorinated dibenzo-p-dioxins and substituted penta-, hexa-, hepta- and octachlorinated dibenzofurans in aqueous and solid samples. The extracts were injected onto a high-resolution gas chromatograph programmed to separate the compounds, which are then detected with a high-resolution mass spectrometer as confirmation.

Inorganics

Target analyte list (TAL) metals and perchlorates were analyzed using USEPA SW-846 methodologies. The laboratory procedures for inorganic compounds are summarized below.

TAL Metals: Aqueous and solid samples were analyzed for TAL metals using a combination of the following methodologies: inductively coupled plasma (ICP) and cold vapor atomic absorption (CVAA). Trace metals were analyzed using USEPA SW-846 3010A/6010B for aqueous samples and USEPA SW-846 Method 3050B/6010B for solid samples. TCLP extracts were digested according to USEPA SW-846 Method 1311/3010A/6010B for the solid IDM samples. The ICP method involved the simultaneous or sequential multi-element determination of trace elements in solution. The basis of the method is the measurement of atomic emission by optical spectrometry. Samples were nebulized and the aerosol that was produced was transported to the plasma torch where excitation occurs. Characteristic atomic-line emission spectra are produced by a radio-frequency ICP. A background correction technique was utilized to compensate for variable background contribution for the determination of trace elements.

Aqueous and solid samples were analyzed for mercury using CVAA according to USEPA SW-846 Method 7470A for aqueous samples and Method 7471A for solid samples. TCLP extracts were digested according to USEPA SW-846 Method 1311/7470A for solid IDM samples. A sample aliquot was initially digested with nitric acid to free combined mercury. The mercury was then reduced to its elemental state and aerated from the solution into a closed system. The mercury vapor was passed through a cell positioned in the path of the mercury light source and the measured abundance was proportional to the concentration of mercury in the sample.

Perchlorate: Perchlorate was analyzed for aqueous samples by using either USEPA SW-846 Method 6850 SIM by HPLC/MS following the *DoD Perchlorate Handbook* (DoD, 2006b) requirements. The HPLC-MS method 6850 uses a second order external standard approach using laboratory ChemStation software. The method provides HPLC-MS conditions for the detection of perchlorate in SIM mode at m/z 83 and 85, which corresponds to the loss of one oxygen atom from the perchlorate molecule. In general, water samples were extracted at a neutral pH with methylene chloride, using LC-MS-CLO_4 method. Sample extracts were injected into the HPLC-MS and the ion ratio of m/z 83 to 85 was used to positively identify the response peak as perchlorate. Quantitation was performed using the m/z 83 peak area. An internal standard of ^{18}O labeled perchlorate was added to each sample to establish the perchlorate peak retention time and used in the quantitation. Confirmation was obtained by the use of the mass spectrometer.

Waste Characterization

Samples collected to characterize IDM were analyzed for hazardous waste characteristics using USEPA-approved methodologies, including TCLP VOCs, TCLP SVOCs, TCLP metals, TCLP pesticides, TCLP herbicides, ignitability, reactive cyanide, reactive sulfide, TCL PCBs, explosives, chemical oxygen demand (COD), biological oxygen demand (BOD), and corrosivity as pH. The laboratory procedures and methodologies are summarized below and in the prior section.

TCLP Extraction: Solid IDM samples were collected for full TCLP waste characterization and extracted using the USEPA SW-846 Method 1311. Aqueous IDM samples were collected for TCLP metals analysis. The final liquid extract was separated from the sample material and combined with the initial liquid phase (if applicable). The sample TCLP extract was then treated as an aqueous sample for analysis for TCLP VOCs, TCLP SVOCs, TCLP pesticides, TCLP herbicides, and TCLP metals. Brief discussions of the procedures and methodologies are presented below and in the prior section.

Explosives/PETN/NG: Solid IDM samples were analyzed for explosives and PETN using USEPA SW-846 Method 8330B/8330A Modified and for NG using USEPA SW-846 Method 8330B/8332 Modified. Brief discussions of these procedures and methodologies are presented in the prior section.

Reactive Cyanide: Solid IDM samples were analyzed for reactive cyanide using USEPA SW-846 Method Chapter 7.3.3. The cyanide as hydrocyanic acid (HCN) was released from cyanide complexes by means of a reflux-distillation operation and absorbed in a scrubber containing sodium hydroxide solution. The cyanide ion in the absorbing solution was then determined colorimetrically. In the colorimetric measurement, the cyanide was converted to cyanogen chloride, CNCl, by reaction with chloramine-T at a pH less than 8.0 without hydrolyzing the cyanate. After the reaction was completed, color was formed on the addition of pyridine-pyrazolone or pyridine-barbituric acid reagent. The absorbance was read at 578 nm for pyridine-barbituric acid. To obtain colors of comparable intensity, the sample and the standards contain the same salt content. The titrimetric measurement uses a standard solution of silver nitrate to titrate cyanide in the presence of a silver sensitive indicator.

Reactive Sulfide: Solid IDM samples were analyzed for reactive sulfide using USEPA SW-846 Method Chapter 7.3.4. This procedure is a colorimetric determination. Sulfide reacts with dimethyl-p-phenylenediamine in the presence of ferric chloride to produce methylene blue.

Flashpoint: Solid IDM samples were analyzed for flashpoint or ignitability using USEPA SW-846 Method 1010. A sample was heated at a slow, constant rate with continual stirring. A small flame was directed into the cup at regular intervals with simultaneous interruption of stirring. The flash point is the lowest temperature at which application of the test flame ignites the vapor above the sample.

TCL PCBs: Solid IDM samples were analyzed for TCL PCBs using USEPA SW-846 Method 3550B/8082. A brief discussion of this procedure and methodology is presented in the prior section.

TCLP VOCs: Solid IDM samples were analyzed for TCLP VOCs using USEPA SW-846 Method 1311/8260B. A brief discussion of this procedure and methodology is presented in the prior section.

TCLP SVOCs: Solid IDM samples were analyzed for TCLP SVOCs using USEPA SW-846 Method 1311/8270C. A brief discussion of this procedure and methodology is presented in the prior section.

TCLP Pesticides: Solid IDM samples were analyzed for TCLP pesticides using USEPA SW-846 Method 1311/8081A. The samples were prepared for analysis using extraction techniques. TCLP pesticide extracts were extracted using a separatory funnel liquid-liquid extraction technique according to USEPA SW-846 Method 1311/3510C for solid IDM samples. The extracts were injected onto a gas chromatography programmed to separate the compounds, which are then detected with an electronic capture device (ECD). Sulfur cleanups were employed to aid in the quantification based upon the matrix interferences. Sample concentrations were confirmed on dissimilar columns.

TCLP Herbicides: Solid IDM samples were analyzed for TCLP herbicides according to USEPA SW-846 Method 1311/8151A. Samples were prepared for analysis using extraction techniques. TCLP herbicide extracts were extracted using a separatory funnel liquid-liquid extraction technique according to USEPA SW-846 Method 1311/3510C for solid IDM samples. The samples were extracted with diethyl ether and then esterified with diazomethane. The derivatives were determined by gas chromatography with an electron capture detector (GC/ECD). The results were reported as acid equivalents. Sample concentrations were confirmed on dissimilar columns.

TCLP Metals: Aqueous and solid IDM samples were analyzed for TCLP metals using a combination of the following methodologies: inductively coupled plasma (ICP) and cold vapor atomic absorption (CVAA). Aqueous IDM samples were extracted using the USEPA SW-846 Method 1311. The final liquid extract was separated from the sample material and combined with the initial liquid phase (if applicable). The sample TCLP extract was then treated as an aqueous sample for analysis for TCLP metals. Brief discussions of these procedures and methodologies are presented in the prior section.

Corrosivity as pH: Aqueous IDM samples were analyzed for corrosivity as pH using USEPA SW-846 Method 9040C. A sample pH was directly measured electrometrically using either a glass electrode in combination with a reference potential or a combination electrode.

BOD: Aqueous IDM samples were analyzed for BOD using USEPA MCAWW Method 405.1. A seeded sample, or an appropriate dilution, was incubated for 5 days at 20 degrees Celsius in the dark. The dilution water or seeded dilution water was added as a buffered salt solution to minimize oxygen uptake. The reduction in dissolved oxygen concentration during the incubation period yields a measure of the biological oxygen demand.

COD: Aqueous IDM samples were analyzed for COD using USEPA MCAWW Method 410.1. Organic and oxidizable inorganic substances were oxidized by potassium dichromate in 50% sulfuric acid solution at reflux temperature. Silver sulfate was used as a catalyst and mercuric sulfate was added to remove chloride interference. The excess dichromate was titrated with standard ferrous ammonium sulfate using orthophenanthroline ferrous complex as an indicator.

Appendix A-2

Quality Assurance/Quality Control Evaluation

QUALITY ASSURANCE/QUALITY CONTROL EVALUATION

The project quality assurance and quality control criteria to perform characterization and remediation activities at eleven Solid Waste Management Units (SWMUs) and Areas of Concern at Radford Army Ammunition Plant (RFAAP) are based on *RFAAP Final Master Work Plan* (MWP) (URS, 2003) as specified in MWP Addendum 019 (Shaw, 2007). The MWP and Addendum 019 were implemented through the integration of well-defined quality control elements for activities associated with the task assignment. The quality control criteria defined for sampling and analysis activities were developed in conjunction with specifications contained in *USACE EM200-1-3, Requirements for the Preparation of Sampling and Analysis Plans*, (USACE, 2001), *DoD Quality Systems Manual for Environmental Laboratories, Final Version 3* (DoD, 2006a), *USEPA Office of Solid Waste and Emergency Response Test Methods for Evaluating Solid Waste Physical/Chemical Methods (SW-846), Update IIIB* (November, 2004), *USEPA Methods for the Chemical Analysis of Water and Wastes* (March, 1983), and *DoD Perchlorate Handbook* (March, 2006b).

Table A-3 outlines the data quality indicators as to their definitions, project goals, sampling and analytical assessments. Data quality was assessed through the evaluation of sampling activities and field measurements associated with the chemical analytical data in order to assess the reliability of the chemical analyses and the accuracy and precision of information acquired from the laboratory.

Table A-3
RFI Data Quality Indicators

Data Quality Indicator	Definition	Goal	Sampling Assessment	Analytical Assessment
Precision	Quantitative measure of the variability of a group of measurements in comparison to the average value	Low relative percent difference	Duplicate samples	MS/MSD or lab sample duplicate; Field sample duplicate
Accuracy	Bias in a measurement system	Low bias	Blank contamination	Analysis spike results (LCS, MS, MSD)
Representativeness	Degree to which the measured results accurately reflect the medium being sampled	100%	Holding times, blanks, associated documentation	Inferred from accuracy, precision, and completeness evaluation
Completeness	Percentage of measurements which are judged to be usable	≥90%	Records review	Data validation
Comparability	Qualitative parameter expressing the confidence with which one data set can be compared with another	High	Work plans, quality documents	Analytical methods
Sensitivity	Quantitative measure of the level of detection and quantitation.	High	Review of analytical method or procedures and instrumentation	Analysis of MDLs and MRLs per analyte, analytical method, and matrix

Review of Documentation

The following documentation was required by the field investigation program in order to provide a quality assessment of data collected during routine investigative activities:

- **Field Logbooks:** Hardback logbooks with numbered pages were used to log daily activities, and data collected during the course of field activities. Designated logbooks were also used to record calibration records and equipment maintenance as they were performed. Entries into field logbooks were evaluated for completeness and accuracy.
- **Field Parameter Table:** Documentation of collected samples was provided to the laboratory on a spreadsheet developed by Shaw specifically for USACE investigations. Field Parameter Tables were electronically generated based on information recorded in field logbooks and Chain-of-Custody for every sample, including QC samples. The completed forms contained the required information for encoding chemical data into Environmental Restoration Information System (ERIS) database.
- **Chain-of-Custody:** Samples were collected and relinquished under stringent Chain-of-Custody protocols as specified in the project MWP. A review of the Chain-of-Custodies identified transcription errors that were corrected by drawing a single line through the incorrect information and subsequently correct information was supplied, dated, and initialed.
- **Sample Tracking Table:** Documentation of collected samples was recorded in an electronic sample tracking table as a tool to track project status. Field entries included the field sample identification, sample depth (where applicable), date collected, laboratory ID, deliverable due dates, and requested laboratory analyses. The status of completeness was tracked from work planning stage through data validation completion.

Sampling activities were performed in compliance with standard operating procedures (SOPs) and each individual performing sampling was aware of the requisite protocols for collection of environmental samples.

Data Reporting

Data packages were provided to Shaw in Shaw Alliance Level 4 CLP-like deliverables with electronic data deliverable files from the laboratory. Detected target compound values above the reporting limit and within the acceptable calibration range were reported as determined to no more than three significant figures. Target analytes detected below the lower calibration standard or the reporting limit (whichever was greater) and above the method detection limit were reported as estimated values “J”. Appropriate data qualifiers were applied during validation process and recorded in an electronic database.

Data Reduction and Validation

Data validation determines the acceptability or unacceptability of the data quality based on a set of pre-defined criteria. Data validation is defined as the systematic process for reviewing a data package against a set of criteria to provide assurance that the data is adequate for its intended uses. These criteria depend upon the type(s) of data involved and the purpose for which data are collected. The intended use of the data and the associated acceptance criteria for data quality was identified before the data collection effort began. Both the organic and inorganic chemical data (except for the waste characterization and natural attenuation data) were validated. The data were validated in accordance with *RFAAP Final Master Work Plan* (URS, 2003) QAP requirements, *DoD Quality Systems Manual for Environmental Laboratories, Final Version 3* (DoD, 2006a), *USEPA Office of Solid Waste and Emergency Response Test Methods for Evaluating Solid Waste Physical/Chemical Methods (SW-846), Update IIIB* (November, 2004), *USEPA Methods for the Chemical Analysis of Water and Wastes* (March, 1983), *DoD Perchlorate Handbook* (March, 2006b), and laboratory SOPs. The data qualifier scheme was consistent with USEPA Region III conventions using the *USEPA Region III Modifications to National Functional Guidelines for Inorganic Data Review* (USEPA, 1993b), *USEPA Region III Modifications to the National Functional Guidelines for Organic Data Review Multi-media, Multi-concentration* (USEPA, 1994c), and the *USEPA Region III Dioxin/Furan Data Validation Guidance* (USEPA, 1999d) as appropriate.

Data packages were validated to ensure compliance with specified analytical, Quality Assurance/Quality Control (QA/QC) requirements, data reduction procedures, data reporting requirements, and required accuracy, precision, and completeness criteria. This includes (as applicable), but is not limited to:

- Sample temperature, preservation, and holding times;
- Instrument performance check (for GC, GC/MS, LC/MS);
- Calibration (initial and continuing);
- Blanks (calibration, preparatory, rinse, trip);
- Matrix spike and spike duplicate recoveries;
- Laboratory and field sample duplicate pairs;
- Surrogate spike recoveries (for organics);
- Laboratory control samples;
- Interference check sample (for metals);
- Serial dilution (for metals);
- Internal standards and retention times (for GC, GC/MS, LC/MS); and,
- Quantitative verification.

Results were assessed for accuracy and precision of laboratory analysis to identify the limitations and quantity of data. The data validation reports are contained in **Appendix A-3**. The quality of the data collected in support of the sampling activity was considered acceptable, unless qualified rejected "R" during the validation process. Samples qualified "B" for blank contamination were considered non-detect at the MRL or level of blank contamination, whichever was greater. Samples qualified "J", "UJ", "L", "UL", or "K" were considered acceptable as estimated or non-detect estimated.

Data Review

Data obtained from both the laboratory and data validation were reviewed by the Shaw Project Chemist to assess whether the project-specific data quality objectives, as defined in the associated MWP, were met.

Data Quality Objectives

Data quality objectives were developed concurrently with the Work Plan to ensure: (1) the reliability of field sampling, chemical analyses, and physical analyses; (2) the collection of sufficient data; (3) the quality of data generated was acceptable for its intended use; and (4) valid assumptions could be inferred from the data. Attainment of data quality objectives was assessed through evaluation of data collected using the following data quality indicators:

- **Precision** - a quantitative measure of the variability of a group of measurements in comparison to the average value;
- **Accuracy** - the bias in a measurement system;
- **Representativeness** - the degree to which the measured results accurately reflect the medium being sampled. Representativeness will be assessed based on accuracy, precision, and completeness;
- **Completeness** - the percentage of measurements which are judged to be useable;
- **Comparability** - defined as a qualitative parameter expressing the confidence with which one data set can be compared with another; and,
- **Sensitivity** - describes the method detection, quantitation, and reporting limits. It also may be expressed as the slope of the analytical curve (intensity verses concentration).

Data quality was assessed through the evaluation of sampling activities and field measurements associated with the chemical data in order to verify the reliability of the chemical analyses and the accuracy and precision of information acquired from the laboratory.

Precision: Method or laboratory precision performed by the laboratory was evaluated during the validation process. Overall sampling or field precision was evaluated during the data review process. Precision is measured by calculating and evaluating the relative percent difference (RPD) between the results of field or laboratory duplicate pairs. The RPD is calculated by the following equation:

$$RPD = \frac{/XA-XB/ * 100}{XM}$$

Where:
XA and XB are duplicate analyses, and
XM is the average value [(XA + XB)/2] of the duplicate analyses.

The RPD was calculated for those analytes which were detected at levels exceeding the method detection limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Analytical results were qualified as estimated (J) for RPDs exceeding criteria for both the sample and its duplicate pair.

Laboratory duplicate sample determinations were used to demonstrate acceptable method precision by the laboratory at the time of analysis and evaluated. Laboratory precision was performed either on the sample and its duplicate pair or the matrix spike and its spike duplicate pair. Duplicate analyses were performed to generate data in order to assess the long-term precision of the analytical method on various matrices. RPDs must be within established control limits.

- **Laboratory Duplicate Analysis:** Laboratory duplicate pairs (dupe) or laboratory spiked duplicate pairs (MSDs) were evaluated for the SWMU 50 and SWMU 59 samples. Laboratory duplicate pairs or laboratory spiked duplicate pairs were within specified precision criteria for each parameter and/or compound except for those compounds listed in the **Table A-4**. Analytical results were qualified as estimated (J) for RPDs exceeding criteria for where the associated compounds were detected, unless qualified for other QC non-conformances. While these parameters were qualified estimated due to the high RPDs, the data was still considered useable, the precision data quality goal was met, and the qualified data did not impact the data quality for the RFI. Further discussion may be found in the data validation reports located in **Appendix A-3**.

Table A-4
Laboratory Duplicate Analysis

Field ID	Analyte	QC Type	Val Qual.	Comments
50SB06A	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB06B	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB07A	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB07B	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB08A	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB08B	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB09A	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB09B	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB010A	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB010B	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB011A	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB011B	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB012A	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate

50SB012B	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB013A	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB013B	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB014A	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB014B	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB015A	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
50SB015B	Arsenic and Chromium	SD	J	High RPDs in Lab Duplicate
59SB03A	Arsenic and Calcium	SD	J	High RPDs in Lab Duplicate
59SB03B	Arsenic and Calcium	SD	J	High RPDs in Lab Duplicate
59SB03C	Arsenic and Calcium	SD	J	High RPDs in Lab Duplicate
59SB06A	Antimony, Arsenic, Calcium, Copper, Iron, Lead, Magnesium, and Zinc	SD	J	High RPDs in Lab Duplicate
59SB06B	Antimony, Arsenic, Calcium, Copper, Iron, Lead, Magnesium, and Zinc	SD	J	High RPDs in Lab Duplicate
59SB06C	Antimony, Arsenic, Calcium, Copper, Iron, Lead, Magnesium, and Zinc	SD	J	High RPDs in Lab Duplicate
59SB05A	Antimony, Arsenic, Calcium, Copper, Iron, Lead, Magnesium, and Zinc	SD	J	High RPDs in Lab Duplicate
59SB05B	Antimony, Arsenic, Calcium, Copper, Iron, Lead, Magnesium, and Zinc	SD	J	High RPDs in Lab Duplicate
59SB05C	Antimony, Arsenic, Calcium, Copper, Iron, Lead, Magnesium, and Zinc	SD	J	High RPDs in Lab Duplicate
59SB04A	Antimony, Arsenic, Calcium, Copper, Iron, Lead, Magnesium, and Zinc	SD	J	High RPDs in Lab Duplicate
59SB04B	Antimony, Arsenic, Calcium, Copper, Iron, Lead, Magnesium, and Zinc	SD	J	High RPDs in Lab Duplicate
59SB04C	Antimony, Arsenic, Calcium, Copper, Iron, Lead, Magnesium, and Zinc	SD	J	High RPDs in Lab Duplicate
TMSB04C	Antimony, Arsenic, Calcium, Copper, Iron, Lead, Magnesium, and Zinc	SD	J	High RPDs in Lab Duplicate
59SB02A	Antimony, Arsenic, Calcium, Copper, Iron, Lead, Magnesium, and Zinc	SD	J	High RPDs in Lab Duplicate
59SB02B	Antimony, Arsenic, Calcium, Copper, Iron, Lead, Magnesium, and Zinc	SD	J	High RPDs in Lab Duplicate
TMSB02B	Antimony, Arsenic, Calcium, Copper, Iron, Lead, Magnesium, and Zinc	SD	J	High RPDs in Lab Duplicate
59SB02C	Antimony, Arsenic, Calcium, Copper, Iron, Lead, Magnesium, and Zinc	SD	J	High RPDs in Lab Duplicate

SD = Sample Duplicate
J = Value is estimated due to QC non-conformance. Reported value may be inaccurate or imprecise.

- **Field Duplicate Analysis:** Field duplicates were collected during the RFI on a 10% frequency per matrix to identify the cumulative precision of the sampling and analytical process, which includes the homogenization of soil samples. The RPD was calculated for those analytes that were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. For where values exceeding calibration range, the diluted values were evaluated. If one of the duplicate pair was non-detect and other <MRL, then the field duplicate was not evaluated. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD (35% RPD for metals) for the aqueous and solid matrix sample pairs. Field precision frequency was conducted on a site-wide basis. Field duplicate pairs were within specified precision criteria for each parameter and/or compound except for those compounds listed in the **Table A-5**. Analytical results were qualified as estimated "J" for exceeding criteria. While these noted parameters were qualified estimated due to the high RPDs, the data was still considered useable, the precision data quality goal was met, and the qualified data did not impact the data quality for the RFI.

Table A-5
Field Duplicate Analysis

Field ID	Duplicate Pair	Analyte	Val Qual.	Comments
59SB04C	TMSB04C	OCDD	J	High RPD
59SB02B	TMSB02B	1,2,3,4,6,7,8-HpCDD, 1,2,3,4,6,7,8-HpCDF, OCDD, and OCDF	J	High RPD

J = Indicates an estimated value due to QC non-conformance. Reported value may not be accurate or precise.

Accuracy: Accuracy is the measure of bias in a system. The accuracy of the results is measured by percent recovery (%R). Laboratory analytical accuracy was assessed through the use of laboratory blanks (method and calibration), rinse blanks, trip blanks, laboratory control samples (LCSs), and matrix spike samples (MSs). Trip blanks were not required for soil samples, but were collected with associated rinse blank samples and evaluated. Laboratory analytical accuracy was reviewed during the validation of data. Sampling accuracy was assessed by evaluating blank contamination and the impact of contaminant contributions originating from non-point sources, such as field sampling equipment decontamination procedures, or laboratory contamination. QC samples evaluated for this assessment included equipment blanks and laboratory method or preparatory blanks. The data validation qualifiers would be applied for analytical non-conformances as outlined in the USEPA Region III validation guidance. Accuracy was measured as percent recovery by the following equation:

$$\%R = \frac{(\text{test value} - \text{spiked value}) * 100}{(\text{true value amount spiked})}$$

The test value is the concentration of the LCS, MS, or MSD determined from analysis. The spiked value for the MS and MSD is the original un-spiked sample concentration and for the LCS is zero. The true value is the concentration of amount spiked into the MS or MSD and the true concentration for the LCS.

Method and calibration blanks, rinse blanks, trip blanks, laboratory control samples, and matrix spikes were evaluated and discussion follows.

Method and Calibration Blanks: A method blank also known as a preparatory blank is a volume of analyte-free water or soil that is processed through the entire analytical scheme (i.e., extraction, digestion, concentration, and analysis) as with the actual samples. Method blanks monitor potential laboratory-induced contamination. Results were qualified "B" for blank contamination by the laboratory and/or through the data validation process. In accordance with USEPA Region III data validation guidelines, reported sample results were considered "non-detect" and qualified with the letter "B" if the detected sample concentration was within 5 times (10 times for common laboratory contaminants: methylene chloride, acetone, 2-butanone, OCDD, OCDF, and common phthalate esters) the concentration in the associated method blank. The method blank contamination assessment was evaluated during the data validation process and may be found in the data validation reports located in **Appendix A-3**. Method blanks were calculated and compared against the same matrix environmental samples on a batch specific basis. Method (preparatory) blanks were reported in ng/L, mg/L, or µg/L units for aqueous matrices and pg/g, mg/kg, or µg/kg for solid matrices. No unit conversions were necessary for method blanks since they were treated in the same manner as the samples. Calibration blanks were also compared against the environmental samples for select parameters. Calibration blanks are aqueous samples and were reported in aqueous units. Performing blank assessments for solid matrix samples, action levels were calculated and expressed in soil units pg/g, µg/kg, or mg/kg from the given aqueous rinse blank or calibration blanks concentrations to be compared against actual solid sample concentrations. This conversion is dependent upon the method performed, sample amounts used, and final digestate or extract volumes used during the analytical analysis. Action levels were based upon 100% solids and 1x dilution factor and adjusted for each sample as appropriate.

- **Method and Calibration Blank Analysis:** For aqueous matrices, the method and calibration blanks were non-detect for all target parameters and/or compounds of interest except for antimony, copper, lead, potassium, sodium, chloroform, and methylene chloride for select sample delivery groups (SDGs). For solid matrices, the method blanks were non-detect for all target parameters and/or compounds of interest except for antimony, aluminum, beryllium, copper, lead, nickel, magnesium, potassium, selenium, sodium, thallium, zinc, OCDD, 2,3,7,8-TCDF, 2,3,4,7,8-PeCDF, 1,2,3,4,6,7,8-HpCDF, 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,7,8-HxCDF, 1,2,3,6,7,8-HxCDF, 1,2,3,4,6,7,8-HpCDF, OCDF, Total TCDFs, Total PeCDFs, Total HxCDFs, and Total HpCDFs for select SDGs. The "B" flagged sample data from the evaluation of QC blanks is presented in **Table A-6**. Analytical results qualified "B" were considered non-detect at the MRL or level of contamination, whichever was greater. Samples meeting the USEPA Region III condition were qualified. While these noted parameters were qualified "B" due to the blank contamination, the data was still considered useable, the accuracy data quality goal was met, and the qualified data did not impact the data quality for the RFI. For each of the other noted analytes not presented in **Table A-6**, the samples were either non-detect for that compound or greater than the blank action level. Further discussion as to method and calibration blanks may be found in the data validation reports located in **Appendix A-3**.

Rinse blanks: The blank contamination assessment was performed to assess the impact of contaminant contributions originating from non-point sources, such as field sampling equipment decontamination procedures. Rinse blanks were intended to identify cross-contamination between samples as a result of sampling equipment decontamination procedures. Rinse blanks were collected by pouring the required volume of de-ionized, organic-free water over the equipment and collecting the water in the appropriate sample containers. Rinse blanks were performed at a rate of one per 20 samples collected or 5% per matrix per sampling technique. The rinse blank results were evaluated to ascertain the efficiency of decontamination and assess the potential for cross-contamination. Rinse blanks were analyzed for the analytes of concern for the RFI. In accordance with USEPA Region III data validation guidelines, the detected concentration in the sample were qualified "B" for blank contamination and was considered non-detect if the sample concentration was within five times (10 times for common laboratory contaminants such as acetone, 2-butanone, methylene chloride, OCDD, OCDF, and phthalate esters) the concentration in the associated equipment blank. Rinse blanks are aqueous samples and were reported in ng/L, µg/L, or mg/L units. Performing blank assessments for solid matrix samples, action levels were calculated and expressed in soil units pg/g, µg/kg, or mg/kg from the given aqueous rinse blank concentrations to be compared against actual solid sample concentrations. This conversion is dependent upon the method performed, sample amounts used, and final digestate or extract volumes used during the analytical analysis. Action levels were based upon 100% solids and 1x dilution factor and adjusted for each sample as appropriate.

- **Rinse Blank Analysis:** Rinse blank RB083007 (low-flow pump) applies to the groundwater samples collected at SWMU 50 and SWMU 59. Rinse blanks 072407R and 072507R apply to the surface soil samples collected at the SWMU 50 and SWMU 59. These rinse blanks were taken from the stainless steel bowl and trowel used to collect the field soil samples. For rinse blank RB083007, all analytes were non-detect for all target parameters and/or compounds of concern except for potassium and sodium. For rinse blank 072407R, all analytes were non-detect for all target parameters and/or compounds of concern except for lead, magnesium, potassium, and sodium. For rinse blank 072507R, all analytes were non-detect for all target parameters and/or compounds of concern except for potassium, sodium , 1,2,3,4,6,7,8-HpCDF, OCDF, and Total HpCDFs. The "B" flagged sample data from the evaluation of QC blanks is presented in **Table A-6**. Analytical results qualified "B" were considered non-detect at the MRL or level of contamination, whichever was greater. Samples meeting the USEPA Region III condition were qualified. While these noted parameters were qualified "B" due to the blank contamination, the data was still considered useable, the accuracy data quality goal was met, and the qualified data did not impact the data quality for the RFI. For each of the other noted analytes not presented in **Table A-6**, the samples were either non-detect for that compound or greater than the blank action level. Further discussion as to rinse blanks may be found in the data validation reports located in **Appendix A-3**.

Trip Blanks: Trip blanks were prepared by the project contract laboratory and accompanied the samples requiring VOC analysis. One trip blank was transported with each VOC sample cooler to the laboratory for each day of sampling. The trip blanks were prepared by pouring the required volume of de-ionized, organic-free water into appropriate sample containers in the laboratory. The trip blanks were analyzed for the TCL VOCs. The trip blank results were used to assess the potential incidental contamination due to sample transport before, during, and after field operations (i.e., exposure to air) and/or contamination due to the sample container. In accordance with USEPA Region III data validation guidelines, the detected concentration in the sample was considered a "non-detect" (i.e., qualified "B" for blank contamination) and was excluded from consideration if the sample concentration was within five times (10 times for common laboratory contaminants such as acetone, 2-butanone, methylene chloride) the concentration in the associated trip blank. Trip blanks are aqueous samples and were reported in µg/L units. Performing blank assessments for solid matrix samples, action levels were calculated and expressed in soil units µg/kg from the given aqueous rinse blank VOC concentrations to be compared against actual solid sample concentrations. This conversion is dependent upon the method performed, sample amounts used, and final volumes used during the analytical analysis. Action levels were based upon 100% solids and 1x dilution factor and adjusted for each sample as appropriate.

- **Trip Blank Analysis:** The trip blank TB083007 applies to the ground water samples collected on 08/29/07 and 08/30/07. The trip blanks 071907TS and 071907TW apply to the surface and subsurface soil samples collected on 07/19/07. The trip blank TB072307 applies to the surface and subsurface soil samples collected on 07/23/07. The trip blanks TB072507S and TB072507W apply to the surface and subsurface soil samples collected on 07/25/07. The trip blanks TB072407S and TB072407W apply to the surface and subsurface soil samples collected on 07/24/07. For trip blanks TB083007, 071907TS, TB072307, TB072407S, TB072407W, TB072507S, and TB072507W, all target analytes were non-detect for all parameters and/or compounds of concern. Chloroform was detected at trace levels in trip blank 071907TW; however, did not impact any associated samples. The "B" flagged sample data from the evaluation of QC blanks is presented in **Table A-6**. Analytical results qualified "B" were considered non-detect at the MRL or level of contamination, whichever was greater. Samples meeting the USEPA Region III condition were qualified. While these noted parameters were qualified "B" due to the blank contamination, the data was still considered useable, the accuracy data quality goal was met, and the qualified data did not impact the data quality for the RFI. For each of the other noted analytes not presented in **Table A-6**, the samples were either non-detect for that compound or greater than the blank action level. Further discussion as to trip blanks may be found in the data validation reports located in **Appendix A-3**.

Table A-6
B-Qualified Data Summary

Field ID	Analyte	Result	LQ	Units	Field ID	Analyte	Result	LQ	Units

J = A = Indicates an estimated value for estimating a concentration <MRL and ≥ MDL.
EMPC = Estimated Maximum Possible Concentration.

Laboratory control samples: The LCSs were analyzed to assess general method performance by the ability of the laboratory to successfully recover the target analytes from a control matrix. The LCS is similar in composition to the method blank. For aqueous analyses, spiked analyte-free reagent water was used. For soil analyses, a purified solid matrix (e.g., sand, sodium sulfate, or other purified solid) was used. The LCSs were spiked with single-component target analytes before it is carried through the preparation, cleanup, and determinative procedures. LCSs were performed at a rate of one per preparation batch per matrix. When samples were not subjected to a separate preparatory procedure (i.e., purge and trap VOC analyses, or aqueous Hg analysis), the CCV may have been used as the LCS, provided the CCV acceptance limits were used for evaluation.

- **Laboratory Control Sample Analysis:** The results of the LCS were evaluated, in conjunction with other QC information during the data validation process to ascertain the acceptability of the data generated for that batch of samples. The LCS samples were evaluated for each SDG and are matrix specific. For LCS samples, USACE DoD QSM and laboratory criteria limits were used for each method in the validation process. The aqueous LCS samples were within specified criteria for all target parameters and/or compounds of concern except for chloromethane, endrin aldehyde, 2,4,5-T, dicamba, 2,4,5-TP, dalapon, HMX, 1,3-dichlorobenzene, and 1,4-dichlorobenzene for select SDGs. The solid LCS samples were within specified criteria for all target parameters and/or compounds of concern except for HMX, endrin aldehyde, delta-BHC, 2,4,5-TP, dalapon, dicamba, dinoseb, 2,4-dinitrophenol, 4,6-dinitro-2-methylphenol, vinyl chloride, chloromethane, 1,3-dichlorobenzene, and 1,4-dichlorobenzene for select SDGs. Data qualifiers were applied as appropriate to associated samples based upon these outliers. Further details may be found in the data validation reports located on a CD at the back of this report. While qualification was applied due to high or low LCS recoveries, the data was still considered useable (except for dalapon – see completeness discussion), the accuracy data quality goal was met, and the qualified data did not impact the data quality for the RFI.

Matrix spikes: The MS was used to assess the performance of the method as applied to a particular project matrix. A MS is an environmental sample to which known concentrations of certain target analytes have been added before sample manipulation from the preparation, cleanup, and determinative procedures have been implemented. The original field sample was mixed or shaken to ensure homogeneous fractions when allowed by the method. MSs were performed at a rate of one per preparation batch or 5% whichever was more frequent per matrix. The results of the MS are evaluated, in conjunction with other QC information during the validation process to assess the effect of the matrix on the bias of the analysis. If a matrix spike duplicate (MSD) was analyzed, it was also evaluated.

- **Matrix Spike and Matrix Spike Duplicate Analysis:** The results of the MS/MSD were evaluated, in conjunction with other QC information during the data validation process to ascertain the acceptability of the data generated for that batch of samples. Only spiked project site SWMU 50 and SWMU59 samples were evaluated. The spiked samples varied among parameter groups, matrices, and SDGs. For MS/MSD samples, USACE DoD QSM and laboratory criteria limits were used for each method in the validation process. For aqueous matrices, MS and MSD samples were within specified criteria for all target parameters and/or compounds of interest except for 4-nitrophenol for spiked

sample 50MW01 for select SDGs. For solid matrices, MS and MSD samples were within specified criteria for all target parameters and/or compounds of interest except for delta-BHC and endrin aldehyde for spiked sample 59SB02A; aluminum, antimony, calcium, chromium, selenium, vanadium, zinc, cobalt, copper, nickel, and thallium for spiked sample 59SB03A; chrysene and 1-methylnaphthalene for spiked sample 59SB04A; antimony, arsenic, cadmium, chromium, cobalt, nickel, selenium, thallium, vanadium, zinc, calcium, magnesium, aluminum, iron, and manganese for spiked sample 50SB06A; 2,4-dimethylphenol and 3,3'-dichlorobenzidine for spiked sample 50SB010A; aluminum, antimony, arsenic, cadmium, calcium, chromium, iron, manganese, nickel, potassium, selenium, silver, sodium, thallium, and vanadium for spiked sample 59SS10; 2,4-D, 2,4,5-TP, 2,4,5-T, dinoseb, and dichloroprop for spiked sample 50SB011A; acetone, cis-1,3-dichloropropene, trans-1,3-dichloropropene, 2-hexanone, 4-methyl-2-pentanone, methyl ethyl ketone, and 1,1,2,2-tetrachloroethane for spiked sample 50SB012A; and aldrin, alpha-BHC, beta-BHC, delta-BHC, gamma-BHC, alpha chlordane, gamma chlordane, dieldrin, 4,4'-DDE, 4,4'-DDT, endosulfan sulfate, endrin aldehyde, endosulfan I, endosulfan II, heptachlor, heptachlor epoxide, methoxychlor, acenaphthene, acenaphthylene, anthracene, chrysene, fluorene, 1-methylnaphthalene, 2-methylnaphthalene, naphthalene, and phenanthrene for spiked sample 50SB014A. All criteria were met for spiked samples 59SB05B, 59SS06, 59SS08, 50SB09A, and 50SB11B for where used as parent sample. The spiked samples were qualified as applicable to USEPA Region III guidance. In some cases, the sample amount was greater than the amount spiked or the associated sample was non-detect for a high recovery; therefore, no qualifiers were required. Further details may be found in the data validation reports located on a CD at the back of this report. While qualification was applied due to high or low MS or MSD recoveries in some cases, the data was still considered useable, the accuracy data quality goal was met, and the qualified data did not impact the data quality for the RFI.

Completeness: Completeness is a measure of the amount of information that must be collected during the field investigation to allow for successful achievement of the objectives. An adequate amount and type of data must be collected for conclusions to be valid. Missing data may reduce the precision of estimates or introduce bias, thus lowering the confidence level of the conclusions. While completeness has been historically presented as a percentage of the data that is considered usable, this does not take into account critical sample locations or critical analytical parameters.

The amount and type of data that may be lost due to sampling or analytical error cannot be predicted or evaluated in advance. The importance of lost or suspect data will be evaluated in terms of the sample location, analytical parameter, nature of the problem, decision to be made, and the consequence of an erroneous decision. Critical locations or parameters for which data is found to be inadequate will either be re-sampled and re-analyzed or the data will be appropriately qualified based on the decision of the project QA manager. The completeness goal percentage of usable data is set at 90%.

Sampling completeness was assessed through evaluation of the total number of samples proposed for collection in the work plan versus the actual number of samples collected and analyzed. Analytical completeness was assessed by comparing the number of useable data points collected to the total number of data points generated. Completeness is calculated using the following equations:

$$\%\,\text{Sampling Completeness} = \frac{\text{No. of actual samples collected}}{\text{No. of proposed samples}}$$

$$\%\,\text{Analytical Completeness} = \frac{\text{No. of usable data}}{\text{No. of requested analyses}}$$

For the purposes of this report, unusable data are defined to include rejected data points ("R" qualifier).

- **Completeness Analysis:** Twenty surface soil samples, twenty subsurface soil samples, three groundwater samples, five field duplicate samples (four soil and one groundwater), two project wide IDM samples (one aqueous and one solid), eight trip blanks, and three rinse blanks were proposed for collection at the SWMU 50 and SWMU 59 as specified in MWP Addendum 019 (Shaw, 2007). The field duplicates, rinse blanks, and IDM samples were collected on a site-wide basis. All samples were collected and analyzed for the parameters as specified in MWP Addendum 019. The resulting sampling completeness quotient is 100% and meets the pre-defined goals of 90% for the sampling program. The overall analytical percent completeness was assessed by parameter group and matrix for the samples collected. Analysis of the all samples resulted in the generation of 10,251 out of 10,253 data points deemed to be useable, generating an overall analytical completeness quotient of 99.9%. Dalapon was rejected for the samples 50MW01 and 50MW02 based upon no recovery found in the LCS resulting in an analytical completeness percentage of 99.6% (495 out of 497 data points) for chlorinated herbicides. All other completeness scenarios for all other parameter groups and/or matrices were 100%. The completeness percentages met the pre-defined goal of 90% for all SWMU 50 and SWMU 59 sampling events and did not impact the overall RFI.

Representativeness: Representativeness is a measure of the degree to which the measured results accurately reflect the medium being sampled. It is a qualitative parameter that is addressed through the proper design of the sampling program in terms of sample location, number of samples, and actual material collected as a "sample" of the whole.

Sampling protocols were developed to assure that samples collected are representative of the media. Field handling protocols (e.g., storage, handling in the field, and shipping) were designed to protect the representativeness of the collected samples. Proper field documentation and QC inspections were used to establish that protocols were followed and that sample identification and integrity was maintained and met pre-defined goals.

Comparability: Comparability is the confidence with which one data set can be compared to another. Comparability was controlled through the use of SOPs that have been developed to standardize the collection of measurements and samples and approved analytical technique with defined QC criteria. USEPA-approved methodologies were used in providing laboratory analytical support for this project. Laboratory SOPs were developed from these methods. Consistent and proper calibration of equipment throughout the field exercises, as described in MWP Addendum 019 and the MWP (URS, 2003), will assist in the comparability of measurements. Field documentation and QA audits were used to establish that protocols for sampling and measurement follow appropriate SOPs and met pre-defined goals.

Levels of Concern

An integral part of the identification of DQOs is the establishment of LOCs. These levels were compared with analytical PQLs and MDLs prior to analytical method selection to ensure the method was capable of addressing project DQOs, preclude occurrence of false negative issues, and assess best available technology limitations. Although LOCs selected as potential concerns may not necessarily reflect RFI-specific objectives, they were developed to ensure that the chosen analytical methods have detection limits sensitive enough to achieve compliance with appropriate site-specific screening levels or other specified criteria for soil. The LOCs for the SWMU 50 and SWMU 59 are based on soil applicable or relevant and appropriate requirements (ARARs) and To-Be-Considered (TBC) guidance and are as follows:

The soil and sediment ARAR/TBC guidance includes:

- RFAAP Facility-Wide Background inorganic soil concentrations (IT, 2001); and
- Oakridge National Laboratory (ORNL) Regional Screening Table – Residential and Industrial Scenarios with a hazard index (HI) = 0.1 for non-carcinogen compounds and a dilution attenuation factor (DAF) = 20 for the SSL Transfer levels (September 12, 2008)

The groundwater and surface water ARAR/TBC guidance includes:

- Oakridge National Laboratory Regional Screening Table – Tap Water Scenario (September 12, 2008) with a hazard index (HI) = 0.1 for non-carcinogen compounds; and
- USEPA Drinking Water Maximum Contaminant Levels (August, 2006)

Sensitivity (quantitation, reporting, and detection limits): The term sensitivity is used broadly to describe the method detection, quantitation, and reporting limits established to meet project-specific data quality objectives; and not limited to the definition which describes the capability of a method or instrument to discriminate between measurement responses. The method detection limits (MDLs) and the practical quantitation limits (PQLs) published within USEPA methods are based upon a reagent water matrix, and are not necessarily reflective of typical sample matrices; therefore, care was taken in establishing limits for laboratory analysis. Methods were selected based upon their sensitivity, technological, and economical considerations while keeping the screening values and available methodology in mind and were sufficient in meeting the given levels of concern (LOCs).

The laboratory generated PQLs and MDLs were compared at the onset of the project. The MDL is the minimum concentration of an analyte that can be measured and reported with a 99% confidence that the analyte is above zero and is identified from the analysis of a sample in a given matrix containing the analyte. The MDLs were derived by the method based upon 40 CFR Chapter 136 Appendix B. The MDL values differ and change periodically because each MDL is laboratory, instrument, analyst, matrix, and method specific. Therefore, the more conservative MDLs were reported where there were multiple instruments and or studies performed. The PQLs are the values at which the laboratory has demonstrated the ability to reliably quantitate the target value of an analyte for the method performed and are based upon the lowest calibration standard used for the initial calibration curve or the lowest verification standard performed. PQLs must be at least 3 times the MDL.

The laboratory used a method reporting limit (MRL) or sample quantitation limit to report non-detects for each sample. The MRL is the threshold value below which the laboratory reports non-detected values as "U," "ND," or "<" and will vary for each sample based upon matrix, dilution, sample volumes, percent moistures (for solids), and the method performed.

Data was calculated over a linear range and the resulting highest concentration within the linear range represents the upper quantitation limit. Each target compound for every sample was reported at a specific level. Any target analytes detected above the MDL, but less than the MRL or 3 times the MDL (whichever was greater), were reported as estimated values "J". Target analytes detected above the upper calibration standard were diluted and analyzed within established calibration windows or qualified. The units used for aqueous samples were ng/L, µg/L, or mg/L and for solid samples were pg/g, µg/kg, or mg/kg.

- **SWMU 50 and SWMU 59 Sensitivity Analysis:** The method sensitivities (i.e., MDLs) were compared to the levels of concern for the samples collected. Comparing the groundwater samples against the ORNL tap water RBCs, 1,1,2,2-tetrachloroethane, 1,1,2-trichloroethane, 1,2-dichloroethane, carbon tetrachloride, chloroform, tetrachloroethene, vinyl chloride, benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, naphthalene, 1,2,4-trichlorobenzene, 1,4-dichlorobenzene, 2,4,6-trichlorophenol, 2,4-dinitrophenol, 3,3'-dichlorobenzidine, 3-nitroaniline, 4,6-dinitro-2-methylphenol, 4-chloroaniline, bis(2-chloroethyl)ether, bis(chloroisopropyl)ether, hexachlorobenzene, hexachlorobutadiene, hexachloroethane, nitrobenzene, n-nitrosodi-n-propylamine, pentachlorophenol, aldrin, dieldrin, heptachlor epoxide, toxaphene, PCB-1016, PCB-1221, PCB-1232, PCB-1242, PCB-1248, PCB-1254, PCB-1260, nitroglycerin, MCPA, MCPP, aluminum, antimony, arsenic, mercury, selenium, thallium, 2,3,7,8-TCDD, 2,3,4,7,8-PECDF, Total PECDD, Total HXCDD, and Total HXCDF had MDLs greater than the given tap water RBCs for select samples. Comparing the groundwater samples against the Drinking Water MCLs, hexachlorobenzene, pentachlorophenol, aluminum, antimony, selenium, and thallium had MDLs greater than the given MCLs for select samples. The samples had higher sensitivity levels due to the given available USEPA method sensitivity capabilities as well as any required sample dilutions and/or sample volume adjustments due to either high analyte concentration and/or matrix interferences. Though an uncertainty may be present with these sensitivity gaps between the MCLs and tap water RBCs to the MDLs for these compounds, it is unlikely that they present an impact to the decisions regarding the RFI.

- Comparing the surface and subsurface soil samples against the USEPA ORNL residential RBCs, benzo(a)pyrene, dibenz(a,h)anthracene, bis(2-chloroethyl)ether, n-nitrosodi-n-propylamine, toxaphene, PCB-1221, PCB-1232, nitroglycerin, cadmium, and thallium had MDLs greater than the given residential RBCs for select samples. Comparing the surface and subsurface soil samples against the USEPA ORNL industrial RBCs, n-nitrosodi-n-propylamine and thallium had MDLs greater than the given industrial RBCs for select samples. Comparing the surface and subsurface soil samples against the ORNL SSL Transfer concentrations, 1,1,2,2-tetrachloroethane, 1,1,2-trichloroethane, 1,2-dichloroethane, 1,2-dichloropropane, carbon tetrachloride, chloroform, tetrachloroethene, vinyl chloride, 1-methylnaphthalene, benzo(a)pyrene, naphthalene, 1,4-dichlorobenzene, 2,4-dinitrophenol, 3,3'-dichlorobenzidine, 3-nitroaniline, 4,6-dinitro-2-methylphenol, 4-chloroaniline, 4-nitroaniline, bis(2-chloroethyl)ether, bis(chloroisopropyl)ether, hexachlorobenzene, hexachlorobutadiene, hexachloroethane, nitrobenzene, n-nitrosodi-n-propylamine, pentachlorophenol, dieldrin, PCB-1221, PCB-1232, PCB-1242, PCB-1248, 1,3-dinitrobenzene, 2-nitrotoluene, nitrobenzene, RDX, nitroglycerin, MCPA, MCPP, arsenic, cadmium, thallium, 2,3,7,8-TCDD, 2,3,4,7,8-PECDF, Total PECDD, Total HXCDD, and Total HXCDF had MDLs greater than the given SSL Transfer concentrations for select samples. Comparing the surface and subsurface soil samples against site-wide metals background concentrations, cadmium and thallium had MDLs greater than the given site-wide metals background for select samples. The samples had higher sensitivities due to the given available USEPA method sensitivity capabilities as well as percent solid adjustments for dryness, and any required sample dilutions or sample volume adjustments due to either high analyte concentration and/or matrix interferences. Though an uncertainty may be present with these sensitivity gaps between the residential RBCs, industrial RBCs, SSL Transfer concentrations, and background concentrations to the MDLs for these compounds, it is unlikely that they present an impact to the decisions regarding the RFI.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Eric Malarek, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Dioxin Furans
SGS Paradigm Analytical Laboratories, Inc. SDGs G383-583
(Accutest SDG F51154)

DATE: September 26, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at Main Manufacturing Area at RFAAP for a RFI/CMS Nine Sites on July 18, 2007 and July 19, 2007. The samples were analyzed for Dioxin Furan compounds using USEPA SW-846 Method 8290 High Resolution Gas Chromatography/High Resolution Mass Spectroscopy (HRGC/HRMS). A total of five aqueous samples and seventeen solid samples were validated. The sample Ids are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
41SW08	F51154-6	41SD11	F51154-22
41SW09	F51154-7	49SS02	F51154-23
41SW10	F51154-8	49SS03	F51154-24
41SD08	F51154-9	49SS04	F51154-25
41SD09	F51154-10	49SS05	F51154-26
41SD10	F51154-11	59SS06	F51154-27
LFSD01	F51154-15	59SS07	F51154-28
TMSD01	F51154-16	59SS08	F51154-29
LFSW01	F51154-17	59SS09	F51154-30
APSD01	F51154-18	59SS10	F51154-31
TMSW01	F51154-20	TMSS05	F51154-32

Data were reviewed and validated using a combination of project QAPP, *DOD Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *USEPA Region III Dioxin/Furan Data Validation Guidance* (March, 1999). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
X		Blank Analysis
	X	Instrument Performance Check
	X	Initial Calibration
	X	Continuing Calibration
	X	Internal Standards (IS) Recovery Standard Solutions
	X	Cleanup Standards
	X	Laboratory Control Standard or Ongoing Precision Result (OPR)
X		Matrix Spike and Spike Duplicate
X		Field Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

RFAAP VALIDATION REPORT
DIOXIN FURAN REVIEW
SDGs G383-583
(Accutest SDG F51154)

I-Holding Times and Preservation

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: For aqueous samples, dioxin and furans are shipped cooled (@4°C ± 2°C) with a maximum holding time of 30 days from sample collection to preparative extraction and 45 days from preparative extraction to determinative analysis. For solid samples, dioxin and furans are shipped cooled (@4°C ± 2°C) with a maximum holding time of 30 days from sample collection to preparative extraction and 45 days from preparative extraction to determinative analysis.

- Temperature Review: The temperature blank was sent with each cooler and recorded by the laboratory upon receipt. For samples collected on 07/18/07 and 07/19/07, the coolers were received by the primary laboratory (Accutest) on 07/20/07 at 4.0°C, 4.0°C, 4.6°C, 4.6°C, 4.8°C, 5.0°C, 5.0°C, and 5.8°C. The herbicides were subcontracted to Accutest TX and were received the samples at 4.2°C, 4.0°C, and 3.6°C. The perchlorate subcontract laboratory (Datachem Laboratories, Inc.) received the aqueous samples at 3.0°C. The dioxin subcontract laboratory (SGS Paradigm Analytical Laboratories, Inc.) received the samples at 5.5°C and 5.2°C. All criteria were met. No qualifiers were applied.

- Holding Time Review: The aqueous and soil samples were collected on 07/18/07 and 07/19/07. For samples collected 07/18/07, the dioxins and furans were extracted on 07/26/07 and 07/29/07 and analyzed on 07/28/07, 07/30/07, and 07/31/07. For samples collected 07/19/07, the dioxins and furans were extracted on 07/26/07, 07/29/07, 07/30/07, and 07/31/07 and analyzed on 07/31/07 and 08/01/07. Sample collection dates may be found on the attached form 1s. All criteria were met. No qualifiers were applied.

II-Blank Analysis

The purpose of laboratory (or field) blank analyses is to determine the existence and magnitude of contamination problems resulting from field and laboratory activities. No contamination should be found in any of the blanks >EDL (estimated detection limit). The DoD QSM criteria specifies all concentrations should be less than ½ MRL (<MRL for common laboratory contaminants OCDD and OCDF) and <2EDL for the calibration blanks. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants OCDD or OCDF, or 5 times (5X) the maximum amount for other target compounds. **Table 2** summarizes the blank contamination analysis. Action levels are based upon dilution factor of one and for solid matrices were converted to soil values (soil conversion factor = 100) if needed. Rinse blank RB083007 (F52208-1) (low-flow pump) applies to the groundwater "GW" samples in this SDG. The surface water "SW" samples were collected directly into the laboratory bottles; therefore, no rinse blank applies for the SW samples. Rinse blanks 072407R (F51275-1) and 072507R (F51300-31) apply to the surface soil "SS" and subsurface soil "SB" samples in this SDG. Rinse blank RB071807 (F51154-12) applies to the sediment "SD" samples in this SDG.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. ng/L	Action Level ng/L	B qualified samples

J = Estimated value <MRL and >EDL.
EMPC = Estimated Maximum Possible Concentration.

III-Instrument Performance Check

Instrument must be tuned with perfluorokerosene (PFK) to achieve a static resolving power of at least 10,000 (10% valley) and lock-mass ion between lowest and highest masses for each descriptor and level of reference compound ≤10%. Documentation of the mass spectrometer resolving power is accomplished by recording the peak profile of the high-mass reference signal (typically m/z 330.9792) obtained during a peak examination by using the low-mass PFK ion at m/z 292.9825 or lower in mass as reference. At the beginning of the each 12-hour period, the chromatographic resolution is verified in the same fashion as in the initial calibration through the analysis of HRCC solution on the DB-5 (or equivalent) column or through the analysis of the column performance solution on the SP-2331 or SP-225 (or equivalent) column. A 25% valley must be achieved between the close eluters.

- All PFK forms were verified and found to be in compliance with method specification. No qualifiers were applied.

IV-Initial Calibration
Once the window defining mix has been analyzed and the descriptor switching times have been verified, the five point calibration solutions can be analyzed prior to sample analysis. Per method and DoD QSM, the initial calibration criteria are as follows:

- The percent relative standard deviations for the mean response factors RRF(n) from the 17 unlabeled standards must not exceed ±20%, and those for the labeled reference compounds must not exceed ±30%;
- The signal to noise ratio ≥10% for all target ions;
- Ion abundance ratios must be within the specified control limits in Table 8 (SW846 Method 8290).

- For initial calibration performed on 07/10/07 for all target compounds on instrument HRMS1, all criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), LFSW01 (F51154-17), APSD01 (F51154-18), TMSW01 (F51154-20), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this initial calibration.

V-Continuing Calibration
The continuing calibration consists of two parts: evaluation of the mass resolution and retention time check. Per method and DoD QSM, the following stipulates the continuing calibration criteria.

- The signal signal-to-noise ratio (S/N) must be at least 10:1 for each selected ion current profile (SICP) and for each GC signal representing the elution of a target analyte or labeled standard for each analyte.
- The relative response factor of each analyte for the unlabeled standard must be within ±20% of the average RF obtained from the initial calibration, and the RRF of each labeled standard must be within ±30% of the average RRF established during initial calibration. This is expressed in term of percent difference %D.
- Ion abundance ratios must be within the specified control limits in Table 8 (SW846 Method 8290).

- For continuing calibration performed on 07/28/07 @02:22 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 07/28/07 @13:44 on instrument HRMS1, all criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), and 41SW10 (F51154-8) apply to this continuing calibration.

- For continuing calibration performed on 07/28/07 @23:29 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 07/30/07 @17:04 on instrument HRMS1, all criteria were met. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), and 41SD11 (F51154-22) apply to this continuing calibration.

- For continuing calibration performed on 07/31/07 @04:20 on instrument HRMS1, all criteria were met. No qualifiers were applied. Samples LFSW01 (F51154-17), TMSW01 (F51154-20), 49SS02 (F51154-23), and 49SS03 (F51154-24) apply to this continuing calibration.

- For continuing calibration performed on 07/31/07 @13:17 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 08/01/07 @00:39 on instrument HRMS1, all criteria were met. No qualifiers were applied. Samples 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), and 59SS10 (F51154-31) apply to this continuing calibration.

- For continuing calibration performed on 08/01/07 @10:25 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 08/01/07 @14:32 on instrument HRMS1, all criteria were met. No qualifiers were applied. Sample TMSS05 (F51154-32) applies to this continuing calibration.

- For continuing calibration performed on 08/02/07 @01:54 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 08/02/07 @12:28 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 08/02/07 @16:03 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 08/03/07 @03:24 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 08/03/07 @14:47 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

VI-Internal Standards (IS) Recovery Standard Solutions
Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Specific criteria include: Recoveries of the isotopically-labeled recovery standards to fall within the 40 to 135 percent range for the tetra- through octachlorinated congeners, or as stated in the data package (DoD QSM limits 40-135%).

- All criteria were met. No qualifiers were applied.

VII-Cleanup Standards
Cleanup standards are added to every sample, blank, quality control sample, and calibration solution. This compound is added to the samples after extraction but prior to cleanup and is used to verify the percent recovery obtained using the isotope dilution technique. The control limits are 40 to 135 percent (DoD QSM limits 40-135%).

- All criteria were met. No qualifiers were applied.

VIII-Laboratory Control Standard (LCS) or Ongoing Precision Result (OPR)
LCSs are used to monitor laboratory accuracy and precision by calculating the percent recoveries of the spiked compounds. Per DOD QSM and method criteria, acceptable performance is determined by:

1. Recoveries of the isotopically-labeled extraction standards to fall within 40-135% control limits for the tetra- through octachlorinated congeners, or as stated in the data package;

2. Recoveries (accuracy) of the unlabeled compounds should be within ±35% when spiked at the method quantitation limit and within ±30% when spiked above 20 times the method quantitation limit, or as stated in the data package;

3. When duplicate OPR are required, the relative percent difference (RPD) of the unlabeled analytes concentrations should be within 30% when spiked at the method quantitation limit and within ±20% when spiked above 20 times the method quantitation limit.

- Sample OPR14381 was used as LCS and LCSD on 07/28/07 analytical run. All criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), and 41SW10 (F51154-8) apply to this LCS.

- Sample OPR14383 was used as LCS and LCSD on 07/30/07 analytical run. All criteria were met. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), and 41SD11 (F51154-22) apply to this LCS.

- Sample OPR14385 was used as LCS and LCSD on 07/31/07 analytical run. All criteria were met. No qualifiers were applied. Samples LFSW01 (F51154-17), TMSW01 (F51154-20), 49SS02 (F51154-23), and 49SS03 (F51154-24) apply to this LCS.

- Sample OPR14389 was used as LCS and LCSD on 08/01/07 analytical run. All criteria were met. No qualifiers were applied. Samples 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this LCS.

IX-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. Per DoD QSM, MS/MSD recoveries must be within in-house laboratory limits (75-125%) and RPD ≤20%.

- Sample LFSW01 (F51154-17) was used for the aqueous MS/MSD analysis on 07/31/07. OCDD (147%, 167%) and 2,3,4,7,8-PeCDF (RPD=21%) were outside lab criteria. For all other congeners, all criteria were met. OCDD was qualified estimated bias high "K" for detects for the spiked sample based upon the high recoveries. The associated LCS was within criteria limits. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this MS/MSD.

- No project specific solid matrix MS/MSD was performed; therefore, it was not evaluated.

X-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field surface water sample duplicate pair LFSW01 (F51154-17) and TMSW01 (F51154-20) was collected for dioxin and furans. All detected dioxin and furans found in the sample and its duplicate pair and associated %RPD are noted in **Table 3**. All other dioxin and furans target compounds were non-detect. Total HpCDDs (71.7%) was above criteria due to low concentration levels detected below the MRL and were reported as estimated maximum possible concentration (EMPC). Total HpCDDs was qualified estimated "J" for the original and duplicate pair samples based upon these outliers. For all other dioxin and furans, all criteria were met.

Table 3 Field Precision Hits Analysis Summary for Dioxin and Furans for Duplicate Pair LFSW01 (F51154-17) and TMSW01 (F51154-20)

Compound	Original Sample (ng/L)	Duplicate Pair (ng/L)	%RPD
1,2,3,4,6,7,8-HpCDD	0.00503J, EMPC	0.00448J	11.6
OCDD	0.0423J	0.0295J	35.7
1,2,3,7,8-PeCDF	0.00593U	0.00178J	NA
1,2,3,4,6,7,8-HpCDF	0.00205J	0.00609U	NA
OCDF	0.00586J	0.0122U	NA
Total HpCDDs	0.00949J, EMPC	0.00448	71.7
Total TCDFs	0.00622J, EMPC	0.00200U	NA
Total HpCDFs	0.00422J, EMPC	0.00609U	NA
Total PeCDFs	0.00202U	0.00373J, EMPC	NA

U = Value non-detect as <EDL.
J = Estimated value <MRL and >EDL. Data point qualified was estimated "J".
NA = Not Applicable.
EMPC = Estimated Maximum Possible Concentration

- Field sediment sample duplicate pair LFSD01 (F51154-15) and TMSD01 (F51154-16) was collected for dioxin and furans. All detected dioxin and furans found in the sample and its duplicate pair and associated %RPD are noted in **Table 4**. All other dioxin and furans target compounds were non-detect. 2,3,7,8-TCDF (59.5%), 1,2,3,7,8-PeCDF (59.9%), 2,3,4,7,8-PeCDF (93.8%), 1,2,3,6,7,8-HxCDF (59.5%), 2,3,4,6,7,8-HxCDF (86.9%), 1,2,3,7,8,9-HxCDF (72.4%), Total TCDFs (84.2%), and Total PeCDFs (90.4%) was above criteria probably due to sample non-homogeneity and/or low sample concentration levels detected below the MRL. 2,3,7,8-TCDF, 1,2,3,7,8-PeCDF, 2,3,4,7,8-PeCDF, 1,2,3,6,7,8-HxCDF, 2,3,4,6,7,8-HxCDF, 1,2,3,7,8,9-HxCDF, Total TCDFs, and Total PeCDFs were qualified estimated "J" for the original and duplicate pair samples based upon these outliers. For all other dioxin and furans, all criteria were met.

Table 4 Field Precision Hits Analysis Summary for Dioxin and Furans for Duplicate Pair LFSD01 (F51154-15) and TMSD01 (F51154-16)

Compound	Original Sample (pg/g)	Duplicate Pair (pg/g)	%RPD

E = Value exceeded calibration range. Data point qualified was estimated "J".
J = Estimated value <MRL and >EDL. Data point qualified was estimated "J".
EMPC = Estimated Maximum Possible Concentration

XI-Quantitation Verification

The accuracy of analytical results was verified through the calculation of at least one the several parameters such as the %D, %RSD, % recovery, and/or compound concentration. Values were found to be within 10%. Any value reported by the laboratory as estimated "A" based on an analyte to internal standard ratio below the calibration curve was qualified as estimated "J". The signal signal-to-noise ratio (S/N) must be greater than 2.5 for each selected ion current profile (SICP) and for each GC signal representing the elution of a target analyte or labeled standard. Any detected value with ether interference (I-lab flag) was qualified as estimated "J". For where the ion ratio failed the 25% criteria (*-lab flag), the estimated maximum possible concentration (EMPC) was reported and flagged estimated "J". For where presence of quantitation interference (Q-lab flag), the date was flagged estimated "J" for detects and "UJ" for non-detects.

- For sample 41SW08 (F51154-6), 1,2,3,7,8-PeCDD, 2,3,4,7,8-PeCDF, Total PeCDDs, and Total PeCDFs were qualified estimated non-detect "UJ" based upon the presence of quantitation interference.

- For sample 59SS09 (F51154-30), Total TCDFs was qualified estimated non-detect "J" based upon the presence of quantitation interference.

- OCDD exceeded upper calibration limit for samples 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), TMSD01 (F51154-16), and TMSS05 (F51154-32). OCDD was qualified estimated "J" for all associated samples based upon these outliers.

Sample: 41SW08 (F51154-6), OCDD

A(x) = sum of the integrated ion abundances of the quantitation ions for the unlabeled ions;
A(is) = sum of the integrated ion abundances of the quantitation ions for the labeled ions;
Q(is) = quantity, in ng/ul, of the internal standard added to the sample before extraction;
W = weight, in g, of the sample (solid or organic liquid) as dry weight, or volume in mL of an aqueous sample; and
Avg. RRF(n) = calculated mean relative response factor for the unlabeled analyte.

$$\text{Conc. (ng/L)} = \frac{(A(x)) * Q(is) * 1000}{A(is) * W * \text{Avg. RRF}} = \frac{(214000+222000) * 4.0 * 1000}{(36700000+40800000) * 953 * 1.0783} = 0.0219 \text{ ng/L}$$

Reported Value = 0.0219 ng/L
% Difference = 0.0%
Values were within 10% difference

Sample: 41SD09 (F51154-10), OCDD

A(x) = sum of the integrated ion abundances of the quantitation ions for the unlabeled ions;

A(is) = sum of the integrated ion abundances of the quantitation ions for the labeled ions;

Q(is) = quantity, in pg, of the internal standard added to the sample before extraction; Here need to multiply concentration (pg/uL) by final extract volume (uL).

W = weight, in g, of the sample (solid or organic liquid) as dry weight, or volume in mL of an aqueous sample; and

Avg. RRF(n) = calculated mean relative response factor for the unlabeled analyte.

$$\text{Conc. (ng/kg)} = \frac{(A(x)) * Q(is)}{A(is) * W * \text{Avg. RRF}} = \frac{(56400000+63100000) * 4.0 * 1000}{(26300000+29500000) * (12.20 * 0.7270) * 1.0783} =$$
$$= 896 \text{ ng/kg} = 896 \text{ pg/g}$$

Reported Value = 897 pg/g
% Difference = 0.1%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ EDL and <MRL or <3*EDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥EDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ EDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Eric Malarek, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Explosives, PETN, & Nitroglycerin
Accutest Laboratories, Inc., SDG F51154

DATE: September 25, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at collected at Main Manufacturing Area at RFAAP for a RFI/CMS Nine Sites on July 18, 2007 and July 19, 2007. Aqueous samples were analyzed for explosives, nitroglycerin, and PETN using USEPA SW-846 3535A/8330A. Solid samples were analyzed for explosives, nitroglycerin, and PETN using USEPA SW-846 8330B/8330A. A total of five aqueous samples and seventeen solid samples were validated. The sample Ids are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
41SW08	F51154-6	41SD11	F51154-22
41SW09	F51154-7	49SS02	F51154-23
41SW10	F51154-8	49SS03	F51154-24
41SD08	F51154-9	49SS04	F51154-25
41SD09	F51154-10	49SS05	F51154-26
41SD10	F51154-11	59SS06	F51154-27

TMSD01	F51154-16	59SS08	F51154-29
LFSW01	F51154-17	59SS09	F51154-30
APSD01	F51154-18	59SS10	F51154-31
TMSW01	F51154-20	TMSS05	F51154-32

Data were reviewed by Eric Malarek and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Blank Analysis
	X	Initial Calibration
	X	Continuing Calibration
	X	System Monitoring Compounds
	X	Laboratory Control Sample
	X	Matrix Spike/Spike Duplicate
	X	Field Duplicate
	X	Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable.

Eric Malarek

RFAAP VALIDATION REPORT
EXPLOSIVES REVIEW
SDG F51154

I-Holding Times and Preservation

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: For aqueous samples, explosive compounds are shipped cooled (@4°C ± 2°C) with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis. For solid samples, explosive compounds are shipped cooled (@4°C ± 2°C) with a maximum holding time of 14 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: The temperature blank was sent with each cooler and recorded by the laboratory upon receipt. For samples collected on 07/18/07 and 07/19/07, the coolers were received by the primary laboratory (Accutest) on 07/20/07 at 4.0°C, 4.0°C, 4.6°C, 4.6°C, 4.8°C, 5.0°C, 5.0°C, and 5.8°C. The herbicides were subcontracted to Accutest TX and were received the samples at 4.2°C, 4.0°C, and 3.6°C. The perchlorate subcontract laboratory (Datachem Laboratories, Inc.) received the aqueous samples at 3.0°C. The dioxin subcontract laboratory (SGS Paradigm Analytical Laboratories, Inc.) received the samples at 5.5°C and 5.2°C. All criteria were met. No qualifiers were applied.

- Holding Time Review: The aqueous and solid samples were collected on 07/18/07 and 07/19/07. For the aqueous samples collected 07/18/07 and 07/19/07, the explosives were extracted on 07/25/07 and analyzed on 07/27/07. For the solid samples collected 07/18/07 and 07/19/07, the explosives were extracted on 08/01/07 and analyzed on 08/03/07. All criteria were met. No qualifiers were applied.

II-Blank Analysis

The purpose of laboratory or field blank analyses is to determine the existence and magnitude of contamination problems resulting from laboratory or field activities. One method blank per analytical batch must be run on each instrument used to analyze samples. No contaminants should be present in the blanks. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤5 times (5x) the maximum amount for explosive target compounds. **Table 2** summarizes the blank contamination analysis. Action levels are based upon dilution factor of one and for solid matrices were converted to soil values (soil conversion factor = 10) if needed. Rinse blank RB083007 (F52208-1) (low-flow pump) applies to the groundwater "GW" samples in this SDG. The surface water "SW" samples were collected directly into the laboratory bottles; therefore, no rinse blank applies for the SW samples. Rinse blanks 072407R (F51275-1) and 072507R (F51300-31) apply to the surface soil "SS" and subsurface soil "SB" samples in this SDG. Rinse blank RB071807 (F51154-12) applies to the sediment "SD" samples in this SDG.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
07/27/07	OP21593-MB	All target explosives <½MRL	NA	NA	None
07/27/07	OP21593-MB	All target explosives <½MRL	NA	NA	None

MRL = Method Reporting Limit
NA = Not Applicable

III-Initial Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. The initial 5-point calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run. The DoD QSM specifies that the correlation coefficient must be ≥0.995 and/or the percent relative standard deviation (%RSD) must be ≤20%. All detects were qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects were qualified as estimated "UJ" for where there were grossly exceeding recoveries. Grossly exceeding is defined as twice the established criteria limits.

- For the explosives initial calibration performed on 10/18/06 on instrument G1315B, all criteria were met for target explosives compounds. All compounds were determined using calibration factors with RSDs ≤20%. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this initial calibration.

- For the explosives initial calibration performed on 10/20/06 on instrument G1315B, all criteria were met for target explosives compounds. All compounds were determined using calibration factors with RSDs ≤20%. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this initial calibration.

- For the PETN and nitroglycerine initial calibration performed on 03/15/07 on instrument G1315B, all criteria were met for target compounds. All compounds were determined using calibration factors with RSDs ≤20%. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), TMSW01 (F51154-20), 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. Continuing calibration standards are analyzed after every 10 injections, and at the end of the analysis sequence. The DoD QSM specifies that the percent difference (%D) from initial calibration should be no greater than ±20%. All detects were qualified as estimated "J" for where there were exceeding %Ds, and all non-detects were qualified as estimated "UJ" for where there were grossly exceeding recoveries. Grossly exceeding is defined as twice the established criteria limits.

- For explosives initial calibration verification performed on 10/18/06 @17:39 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples reported apply to this initial verification calibration.

- For explosives initial calibration verification performed on 10/19/06 @13:44 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples reported apply to this initial verification calibration.

- For explosives initial calibration verification performed on 10/20/06 @14:03 on instrument G1315B, nitrobenzene (20.5%) was outside criteria. All samples were non-detect for this compound. No qualifiers were applied. No samples reported apply to this initial verification calibration.

- For explosives initial calibration verification performed on 10/20/06 @15:10 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples reported apply to this initial verification calibration.

- For explosives continuing calibration performed on 07/27/07 @10:31 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 41SW08 (F51154-6) and 41SW09 (F51154-7) apply to this continuing calibration.

- For explosives continuing calibration performed on 07/27/07 @14:11 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this continuing calibration.

- For explosives continuing calibration performed on 07/27/07 @16:57 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For explosives continuing calibration performed on 07/27/07 @18:36 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), and 41SW10 (F51154-8) apply to this continuing calibration.

- For explosives continuing calibration performed on 07/27/07 @20:33 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples apply to this continuing calibration.

- For explosives continuing calibration performed on 08/02/07 @22:39 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), and APSD01 (F51154-18) apply to this continuing calibration.

- For explosives continuing calibration performed on 08/03/07 @04:11 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), and 59SS10 (F51154-31) apply to this continuing calibration.

- For explosives continuing calibration performed on 08/03/07 @09:41 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Sample TMSS05 (F51154-32) applies to this continuing calibration.

- For explosives continuing calibration performed on 08/03/07 @15:37 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For PETN and nitroglycerin initial calibration verification performed on 03/15/07 @12:35 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For PETN and nitroglycerin continuing calibration performed on 07/27/07 @13:19 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this continuing calibration.

- For PETN and nitroglycerin continuing calibration performed on 07/27/07 @15:29 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For PETN and nitroglycerin continuing calibration performed on 08/03/07 @09:24 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), and APSD01 (F51154-18) apply to this continuing calibration.

- For PETN and nitroglycerin continuing calibration performed on 08/03/07 @10:59 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), and 59SS10 (F51154-31) apply to this continuing calibration.

- For PETN and nitroglycerin continuing calibration performed on 08/03/07 @12:41 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Sample TMSS05 (F51154-32) applies to this continuing calibration.

- For PETN and nitroglycerin continuing calibration performed on 08/03/07 @13:33 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples reported apply to this continuing calibration.

V-System Monitoring Compound (Surrogates)
Laboratory performance on individual samples is established by means of spiking activities. The percent recovery (%R) for all samples and blanks must be within the laboratory control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Criteria: 3,4-dinitrotoluene (70-136%)
Solid Criteria: 3,4-dinitrotoluene (72-145%)

- All criteria were met for explosives, PETN, and nitroglycerin. No qualifiers were applied.

VI-Laboratory Control Sample
Laboratory control samples (LCS) are used to monitor long-term accuracy of the analytical method. The analysis is performed at a frequency of 1 per analytical batch. The percent recoveries (%Rs) must be within the laboratory control limits. DoD QSM aqueous LCS recovery limits are specified in Table D-12 of the DoD QSM (DoD, 2006). DoD QSM solid LCS recovery limits are specified in Table D-2 and Table D-13 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP21593-BS was used as aqueous LCS for explosives analyzed on 07/27/07. All criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this LCS.

- Sample OP21593-BS was used as aqueous LCS for explosives analyzed on 07/27/07. HMX (136%) was outside DoD QSM criteria and within laboratory criteria. All samples were non-detect HMX; therefore, no qualifiers were applied based upon this outlier. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this LCS.

- Sample OP21693-BS was used as solid LCS for explosives analyzed on 08/02/07. All criteria were met. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this LCS.

- Sample OP21593-BS2 was used as aqueous LCS for PETN and nitroglycerin analyzed on 07/27/07. All criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this LCS.

- Sample OP21693-BS2 was used as solid LCS for PETN and nitroglycerin analyzed on 08/03/07. All criteria were met. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this LCS.

VII-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the laboratory control limits. DoD QSM aqueous MS/MSD recovery limits follow the LCS criteria and are specified in Table D-12 of the DoD QSM (DoD, 2006). DoD QSM solid MS/MSD recovery limits follow the LCS criteria and are specified in Table D-2 and Table D-13 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample 41SW09 (F51154-7) was used as the aqueous MS/MSD for the explosive analysis on 07/27/07. HMX (121%, 118%) was outside DoD QSM criteria and within laboratory criteria. All samples were non-detect HMX; therefore, no qualifiers were applied based upon these outliers. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this MS/MSD.

- Sample APSD01 (F51154-18) was used as the solid MS/MSD for the explosive analysis on 08/03/07. 2,6-Dinitrotoluene (RPD=18%), 2,4-dinitrotoluene (131%, RPD=20%), 2-amino-4,6-dinitrotoluene (126%), and 4-amino-2,6-dinitrotoluene (RPD=19%) were outside DoD QSM criteria and/or laboratory criteria. All associated samples were non-detect for these compounds; therefore, no qualifiers were applied based upon these outliers. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this MS/MSD.

- Sample LFSW01 (F51154-17) was used as the aqueous MS/MSD for the PETN and nitroglycerin analysis on 07/27/07. All criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this MS/MSD.

- Sample TMSD01 (F51154-16) was used as the solid MS/MSD for the PETN and nitroglycerin analysis on 07/02-03/07. Nitroglycerin (RPD=27%) was above lab criteria. For PETN, all criteria were met. All associated samples were non-detect for nitroglycerin; therefore, no qualifiers were applied based upon this outlier. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this MS/MSD.

VIII-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field surface water sample duplicate pair LFSW01 (F51154-17) and TMSW01 (F51154-20) was collected for explosives, nitroglycerin, and PETN. All explosives, nitroglycerin, and PETN target compounds were non-detect. All criteria were met. No qualifiers were applied.

- Field surface soil sample duplicate pair 49SS05 (F51154-26) and TMSS05 (F51154-32) was collected for explosives, nitroglycerin, and PETN. All explosives, nitroglycerin, and PETN target compounds were non-detect. All criteria were met. No qualifiers were applied.

- Field sediment sample duplicate pair LFSD01 (F51154-15) and TMSD01 (F51154-16) was collected for explosives, nitroglycerin, and PETN. All explosives, nitroglycerin, and PETN target compounds were non-detect. All criteria were met. No qualifiers were applied.

IX-Quantitation Verification

The accuracy of analytical results was verified through the calculation of several parameters. The calculation was based calibration factors. The absolute percent difference (%D) between the calculated and the reported value must be within 10% difference. All values >MDL and <MRL or <3*MDL (whichever was greater) were qualified as estimated "J".

- The %D between the primary and secondary columns was within criteria for all detected explosives, PETN, and nitroglycerin.

Sample: 41SW08 (F51154-6), 2-amino-4,6-dinitrotoluene

Conc. µg/L = (Ax * Vt * DF) / (CF * Vs)

where: Conc. = Sample concentration in µg/L
Ax = Area of characteristic ion for compound being measured.
Vt = Volume of total extract (mL).
CF = Average relative calibration factor for compound being measured (from ICAL)
Vs = Volume of sample extracted (mL).
DF = Dilution factor

Conc. µg/L = (199179 * 10 * 1) / (7177 * 1010) = 0.27 µg/L (Signal #1)

Reported Value = 0.27 µg/L
% Difference = 0.0%
Values were within 10% difference

Sample: LFSW01MS (F51154-17MS), nitroglycerin

Conc. µg/L = (Ax * Vt * DF) / (CF * Vs)

where: Conc. = Sample concentration in µg/L
Ax = Area of characteristic ion for compound being measured.
Vt = Volume of total extract (mL).
CF = Average relative calibration factor for compound being measured (from ICAL)
Vs = Volume of sample extracted (mL).
DF = Dilution factor

Conc. µg/L = (3198546 * 10 * 1) / (1228 * 430) = 60.6 µg/L (Signal #1)

Reported Value = 60.6 µg/L
% Difference = 0.0%
Values were within 10% difference

Sample: APSD01MS (F51154-18MS), nitrobenzene

Conc. mg/kg = (Ax * Vt * DF) / (CF * Ws * D)

where: Conc. = Sample concentration in mg/kg
Ax = Area of characteristic ion for compound being measured.
Vt = Volume of total extract (mL).
CF = Average relative calibration factor for compound being measured (from ICAL)
W(s) = Weight of sample in kilograms.
D = Percent dry weight (100 - % moisture in sample)/100
DF = Dilution factor

Conc. mg/kg = (4241037 * 20 * 1) / (7223 * 2.45 * 1) = 4970 µg/kg (Signal #1)
Reported Value = 4970 µg/kg
% Difference = 0.0%
Values were within 10% difference

Sample: TMSD01MS (F51154-16MS), nitroglycerin

Conc. mg/kg = (Ax * Vt * DF) / (CF * Ws * D)

where: Conc. = Sample concentration in mg/kg
Ax = Area of characteristic ion for compound being measured.
Vt = Volume of total extract (mL).
CF = Average relative calibration factor for compound being measured (from ICAL)
W(s) = Weight of sample in kilograms.
D = Percent dry weight (100 - % moisture in sample)/100
DF = Dilution factor

Conc. mg/kg = (3248217 * 20 * 1) / (1228 * 2.68 * 1) = 19700 µg/kg (Signal #1)
Reported Value = 19700 µg/kg
% Difference = 0.0%
Values were within 10% difference

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I RFAAP Project Manager

FROM: Eric Malarek, Shaw E&I RFAAP Project Chemist

SUBJECT: Radford Army Ammunition Plant (RFAAP) Data Validation – Herbicides
Accutest Laboratories, Inc., SDG F51154

DATE: September 25, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at Main Manufacturing Area at RFAAP for a RFI/CMS Nine Sites on July 18, 2007 and July 19, 2007. Aqueous samples were analyzed for chlorinated herbicides using USEPA SW846 Method 3510C/8151A. Solid samples were analyzed for chlorinated herbicides using USEPA SW846 Method 3550B/8151A. A total of five aqueous samples and seventeen solid samples were validated. The sample Ids are:

Data were reviewed by Eric Malarek and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times
X		Initial Calibration
X		Continuing Calibration
	X	Blank Analysis
	X	System Monitoring Compounds
X		Laboratory Control Sample
	X	Matrix Spike/Spike Duplicate
	X	Field Duplicate
	X	Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

RFAAP VALIDATION REPORT
CHLORINATED HERBICIDES REVIEW
SDG F51154

I-Holding Times

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: For aqueous samples, chlorinated herbicides compounds are shipped cooled (@4°C ± 2°C) with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis. For solid samples, chlorinated herbicides compounds are shipped cooled (@4°C ± 2°C) with a maximum holding time of 14 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: The temperature blank was sent with each cooler and recorded by the laboratory upon receipt. For samples collected on 07/18/07 and 07/19/07, the coolers were received by the primary laboratory (Accutest) on 07/20/07 at 4.0°C, 4.0°C, 4.6°C, 4.6°C, 4.8°C, 5.0°C, 5.0°C, and 5.8°C. The herbicides were subcontracted to Accutest TX and were received the samples at 4.2°C, 4.0°C, and 3.6°C. The perchlorate subcontract laboratory (Datachem Laboratories, Inc.) received the aqueous samples at 3.0°C. The dioxin subcontract laboratory (SGS Paradigm Analytical Laboratories, Inc.) received the samples at 5.5°C and 5.2°C. All criteria were met. No qualifiers were applied.

- Holding Time Review: The aqueous and solid samples were collected on 07/18/07 and 07/19/07. For aqueous samples collected 07/18/07 and 07/19/07, the herbicides were extracted on 07/24/07 and analyzed on 07/25/07. For solid samples collected 07/18/07 and 07/19/07, the herbicides were extracted on 07/24/07 and analyzed on 07/27/07 and 07/28/07. All criteria were met. No qualifiers were applied.

II-Initial Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The DoD QSM specifies that the percent relative standard deviation (%RSD) for a 5-point standard calibration should be ≤20% for each target compound.

- No initial calibration was provided for MCPP and MCPA on instrument GC-GG. During discussions with the laboratory, they indicated that they perform a daily single point calibration rather than a five point calibration. All samples were non-detect and qualified estimated "UJ" based upon this outlier. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), TMSW01 (F51154-20), 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this single point calibration.

- For initial calibration performed on 07/25/07 on instrument GC-GG, all criteria were met for signal #1 and signal #2 for all target compounds, except MCPP and MCPA. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), TMSW01 (F51154-20), 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this initial calibration.

III-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Continuing calibration establishes the response factors on which the quantitations are based and checks satisfactory performance of the instrument on a day-to-day basis. The DoD QSM specifies that the percent difference (%D) between the initial calibration CF and the continuing calibration CF must be ≤20%.

- A single point calibration was provided for MCPP and MCPA on instrument GC-GG for 07/25/07 run. The calibration standard indicated adequate response for MCPP and MCPA. However, since a five point calibration was not performed, %D calculation could not be verified. All samples were non-detect and qualified estimated "UJ" based upon this outlier. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), TMSW01 (F51154-20), 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this single point calibration.

- For continuing calibration performed on 07/25/07 @11:38 on instrument GC-GG, all criteria were met for signal #1 and signal #2 for all target compounds, except MCPP and MCPA. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this continuing calibration.

- For continuing calibration performed on 07/25/07 @17:37 on instrument GC-GG, all criteria were met for signal #1 and signal #2 for all target compounds, except MCPP and MCPA. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 07/25/07 @19:25 on instrument GC-GG, all criteria were met for signal #1 and signal #2 for all target compounds. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 07/27/07 @12:05 on instrument GC-GG, all criteria were met for signal #1 and signal #2 for all target compounds, except MCPP and MCPA. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), and 49SS04 (F51154-25) apply to this continuing calibration.

- For continuing calibration performed on 07/27/07 @18:56 on instrument GC-GG, all criteria were met for signal #1 and signal #2 for all target compounds, except MCPP and MCPA. No qualifiers were applied. Samples 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this continuing calibration.

- For continuing calibration performed on 07/27/07 @23:27 on instrument GC-GG, all criteria were met for signal #1 and signal #2 for all target compounds, except MCPP and MCPA. No qualifiers were applied. Samples 49SS02 (F51154-23), 49SS03 (F51154-24) apply to this continuing calibration.

- For continuing calibration performed on 07/28/07 @02:08 on instrument GC-GG, all criteria were met for signal #1 and signal #2 for all target compounds, except MCPP and MCPA. No qualifiers were applied. No samples reported apply to this continuing calibration.

IV-Blank Analysis

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field or laboratory activities. No contaminants should be detected in any of the associated blanks. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are qualified "B" if the concentration of the analyte is ≤ five times (5x) the absolute maximum blank concentration. **Table 2** summarizes the blank contamination analysis. Action levels are based upon dilution factor of one and for solid matrices were converted to soil values (soil conversion factor = 33) if needed. Rinse blank RB083007 (F52208-1) (low-flow pump) applies to the groundwater "GW" samples in this SDG. The surface water "SW" samples were collected directly into the laboratory bottles; therefore, no rinse blank applies for the SW samples. Rinse blanks 072407R (F51275-1) and 072507R (F51300-31) apply to the surface soil "SS" and subsurface soil "SB" samples in this SDG. Rinse blank RB071807 (F51154-12) applies to the sediment "SD" samples in this SDG.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
07/25/07	OP7755-MB	All target compounds <½MRL	NA	NA	None
09/10/07	RB083007	All target compounds <½MRL	NA	NA	None
Analysis Date	**QC Blank ID**	**Compound**	**Max Conc. µg/kg**	**Action Level µg/kg**	**B qualified samples**
07/27/07	OP7756-MB	All target compounds <½MRL	NA	NA	None
07/25/07	RB071807	All target compounds <½MRL	NA	NA	None
08/03/07	072407R	All target compounds <½MRL	NA	NA	None
08/03/07	072507R	All target compounds <½MRL	NA	NA	None

V-System Monitoring Compounds (Surrogates)

Laboratory performance on individual samples is established by means of spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. Spike recoveries must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Control Limit: 2,4-DCAA (34-179%)
Solid Control Limit: 2,4-DCAA (34-179%)

- For sample 49SS02 (F51154-23), surrogate 2,4-DCAA was above criteria limits due to double spiking (lab error). The surrogate adjusted (145%) and within criteria. No qualifiers were applied based upon this outlier.

- For sample 49SS03 (F51154-24), surrogate 2,4-DCAA was above criteria limits due to double spiking (lab error). The surrogate adjusted (137%) and within criteria. No qualifiers were applied based upon this outlier.

- For sample 59SS10 (F51154-31), surrogate 2,4-DCAA (338%) was above criteria limits. The sample was non-detect for all target compounds; therefore, no qualifiers were applied based upon this outlier.

- For all other samples, all criteria were met.

VI-Laboratory Control Samples
Data for laboratory control samples (LCS) are generated to determine long-term precision and accuracy of the analytical method. Percent recoveries must be within the specified control limits. DoD QSM aqueous LCS recovery limits are specified in Table D-8 of the DoD QSM (DoD, 2006). DoD QSM solid LCS recovery limits are specified in Table D-2 and Table D-9 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP7755-BS was used as the aqueous LCS for the 07/25/07 run. Dinoseb (98%) was above DoD QSM criteria and within laboratory criteria. All samples were non-detect for dinoseb; therefore, no qualifiers were applied based upon this outlier. All other herbicides were within criteria. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this LCS.

- Sample OP7756-BS was used as the solid LCS for the 07/27/07 run. Dicamba (150%) and dinoseb (55%) were above DoD QSM criteria and/or laboratory criteria. All samples were non-detect for dinoseb; therefore, no qualifiers were applied based upon this outlier. Dicamba was qualified estimated bias high "K" for detects and no qualifier for non-detects based upon the high recovery. All other herbicides were within criteria. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this LCS.

VII-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD QSM aqueous MS/MSD recovery limits follow the LCS criteria and are specified in Table D-8 of the DoD QSM (DoD, 2006). DoD QSM solid MS/MSD recovery limits follow the LCS criteria and are specified in Table D-2 and Table D-9 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample LFSW01 (F51154-17) was used for the aqueous MS/MSD analysis on 07/25/07. All criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this MS/MSD.

- Sample TMSS05 (F51154-32) was used as the solid MS/MSD for the 07/27/07 run. 2,4-D (142%), 2,4,5-TP (149%; RPD=30%), dinoseb (RPD=40%), and dalapon (147%) were above DoD QSM criteria and/or laboratory criteria. All samples were non-detect for 2,4-D, 2,4,5-TP, dinoseb, and dalapon; therefore, no qualifiers were applied based upon these outliers. All other herbicides were within criteria. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this MS/MSD.

VIII-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were qualified because of blank contamination (B-qualified) or were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field surface water sample duplicate pair LFSW01 (F51154-17) and TMSW01 (F51154-20) was collected for chlorinated herbicides. All chlorinated herbicides target compounds were non-detect. All criteria were met. No qualifiers were applied.

- Field surface soil sample duplicate pair 49SS05 (F51154-26) and TMSS05 (F51154-32) was collected for chlorinated herbicides. All chlorinated herbicides target compounds were non-detect. All criteria were met. No qualifiers were applied.

- Field sediment sample duplicate pair LFSD01 (F51154-15) and TMSD01 (F51154-16) was collected for chlorinated herbicides. All chlorinated herbicides target compounds were non-detect. All criteria were met. No qualifiers were applied.

IX-Quantitation Verification
The accuracy of analytical results is verified through the calculation of several parameters. Percent difference (%D) between the calculated value and the reported value must be within 10%. All positive values must have less than or equal to 40% %D between the primary and secondary columns. Any sample value >MDL and <MRL is qualified as estimated, "J." All criteria were met. No qualifiers were applied.

- The %D between the primary and secondary columns was within criteria for all detected chlorinated herbicides.

Sample: LFSW01MS (F51154-17MS), 2,4-DB

Conc. µg/L = (Amt * DF * Vt) / (CF * Vo)

where: Amt = the response on column (ng/mL) of the sample
CF = Calibration Factor (from initial calibration)
Vt = volume of final extract (mL)
DF = dilution factor
Vo = volume of the sample extracted (mL)

Conc. µg/L = (1734556 ng/mL * 1 * 10 mL) / (4558* 1000 mL)
= 3.8 ng/mL = 3.8 µg/L

Reported Conc. = 3.8 µg/L
%D = 0.0%
Values were within 10% difference

Sample: 49SS03 (F51154-24), 2,4-DB

Conc. µg/kg = (Amt * Ve * DF) / (CF * Ws * D)

where: Amt = the response on column (µg/mL) of the sample
CF = Calibration Factor (from initial calibration)
Ve = Final Volume of extract (mL)
DF = Dilution factor
W(s) = Weight of sample in grams.
D = Percent dry weight (100 - % moisture in sample)/100

Conc. µg/kg = (1158430 * 10 * 1) / (4558* 30.0 * 0.920) = 92.1 µg/kg

Reported value = 92.1 µg/kg
%D = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

A (Dioxins) = MDL is based upon the signal-to-noise measurement.

B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics and Dioxins) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

D (Organics) = Indicates sample was analyzed at a dilution.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

E (Dioxins) = Reported value is estimated because of the presence of ether interferences.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/F ions is outside accepted ranges. The detected PCDD/F is reported as an estimated maximum possible concentration (EMPC).

I (Dioxins) = Reported value is estimated because of the incorrect isotope rations were obtained.

J (All) = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, (2) estimating a concentration <MRL and ≥ MDL, or estimating a concentration below the calibration range.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

U (All) = ND = BQL = Not detected. The associated number indicates the compound reporting limit for the sample.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Eric Malarek, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – TAL Metals
Accutest Laboratories, Inc., SDG F51154

DATE: September 25, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at Main Manufacturing Area at RFAAP for a RFI/CMS Nine Sites on July 18, 2007 and July 19, 2007. Aqueous samples were analyzed for target analyte list (TAL) metals using USEPA SW-846 3010A/6010B for ICP metals and SW-846 7470A for mercury. Solid samples were analyzed for target analyte list (TAL) metals using USEPA SW-846 3050B/6010B for ICP metals and SW-846 7471A for mercury. A total of five aqueous samples and seventeen solid samples were validated. The sample Ids are:

Data were reviewed by Eric Malarek and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Inorganic Data Review* (April, 1993). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times
X		Initial and Continuing Calibration
X		Blank Analysis
	X	ICP Interference Check Sample (ICS)
	X	Laboratory Control Sample (LCS)
	X	Laboratory Sample Duplicate
X		Matrix Spike and Spike Duplicate
X		ICP Serial Dilution
X		Field Sample Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Eric Malarek, Chemist

RFAAP VALIDATION REPORT
METALS REVIEW
SDG F51154

I-Holding Times

The primary objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample analysis. Holding time criteria: For aqueous matrices, the samples are shipped cool @4°C±2°C and preserved to pH<2 with HNO_3 with a maximum holding time is 180 days for ICP metals and 28 days for mercury. For solid matrices, the samples are shipped cool @4°C±2°C with a maximum holding time is 180 days for ICP metals and 28 days for mercury.

- Temperature Review: The temperature blank was sent with each cooler and recorded by the laboratory upon receipt. For samples collected on 07/18/07 and 07/19/07, the coolers were received by the primary laboratory (Accutest) on 07/20/07 at 4.0°C, 4.0°C, 4.6°C, 4.6°C, 4.8°C, 5.0°C, 5.0°C, and 5.8°C. The herbicides were subcontracted to Accutest TX and were received the samples at 4.2°C, 4.0°C, and 3.6°C. The perchlorate subcontract laboratory (Datachem Laboratories, Inc.) received the aqueous samples at 3.0°C. The dioxin subcontract laboratory (SGS Paradigm Analytical Laboratories, Inc.) received the samples at 5.5°C and 5.2°C. All criteria were met. No qualifiers were applied.

- Holding Time Review: Samples were collected 07/18/07 and 07/19/07 for metals analysis. For aqueous samples collected 07/18/07 and 07/19/07, they were digested on 07/26/07 and analyzed on 07/27/07 for ICP metals. For solid samples collected 07/18/07 and 07/19/07, they were digested on 07/25/07 and 07/26/07 and analyzed on 07/25/07, 07/26/07, and 07/27/07 (Mn & Zn) for ICP metals. For aqueous samples collected 07/18/07 and 07/19/07, they were digested on 07/25/07 and analyzed on 07/25/07 for mercury. For solid samples collected 07/18/07 and 07/19/07, they were digested on 07/26/07 and analyzed on 07/26/07 for mercury (two runs). All criteria were met. No qualifiers were applied.

II-Initial and Continuing Calibration

Requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable quantitative data. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of the analysis run, and continuing calibration verification documents that the initial calibration is still valid.

ICP:	1- blank (DoD QSM <½ MRL)	Hg:	1 – blank (DoD QSM <½ MRL)
	3 – standards (r≥0.995)		5 – standards (r≥0.995)
	ICV/CCV (90-110%) (DoD QSM 90-110%)		ICV/CCV (80-120%)(DoD QSM ICV 90-110% & CCV 80-120%)
	MRL (70-130%) (DoD QSM 80-120%)		MRL (80-120%) (DoD QSM 80-120%)
	High Std. (95-105%)		High Std. (95-105%)

- The aqueous samples were analyzed for ICP metals on 07/27/07. The solid samples were analyzed for ICP metals on 07/25/07, 07/26/07, and 07/27/07 (Mn & Zn). Mercury was analyzed for the aqueous samples on 07/25/07 with a correlation coefficient of 0.9998. Mercury was analyzed for the solid samples on 07/26/07 with a correlation coefficient of 0.9998. Mercury was analyzed for the solid samples on 07/26/07 (second run) with a correlation coefficient of 0.9991. For 07/26/07 ICP run, zinc (CCV5=110.5%) was outside criteria; however, no samples were bracketed by this CCV for zinc. No qualifiers were applied based upon this outlier. For 07/27/07 ICP run, zinc (CCV14=88.5% and CCV18=89.5%) were outside criteria; however, no samples were bracketed by these CCVs for zinc. No qualifiers were applied based upon these outliers. All other ICV/CCV/High Standard criteria were met for all other metals and runs. **Table 2** summarizes the MRL standard analysis. Samples with concentrations detected less than two times the MRL with out of criteria MRL recovery were qualified.

Table 2 MRL Analysis Summary

Analysis Date	Analysis	MRL (µg/L)	MRL %Recovery	Qualified samples @ <2xMRL	Validation Qualifiers

07/26/07	Hg	0.083	All within criteria	None	None

III-Blanks

Blanks (preparation and calibration blanks) are assessed to determine the existence and magnitude of contamination problems. No contaminants should be detected (i.e. <MDL) in any of the associated blanks. DoD QSM limits are <½MRL for the method blank and <2*MDL for the calibration blanks. Samples are qualified "B" when they are less than 5x the absolute value of the maximum blank concentration. **Table 3** summarizes the blank contamination analysis. Action levels are based upon dilution factor of one and for solid matrices were converted to soil values (soil conversion factor = 10 for ICP and Hg = 12) if needed. Rinse blank RB083007 (F52208-1) (low-flow pump) applies to the groundwater "GW" samples in this SDG. The surface water "SW" samples were collected directly into the laboratory bottles; therefore, no rinse blank applies for the SW samples. Rinse blanks 072407R (F51275-1) and 072507R (F51300-31) apply to the surface soil "SS" and subsurface soil "SB" samples in this SDG. Rinse blank RB071807 (F51154-12) applies to the sediment "SD" samples in this SDG.

J = Estimated value <MRL and >MDL. Data point qualified was estimated "J".

IV-ICP Interference Check Sample (ICS)

The ICP interference check sample (ICS) verifies interelement and background correction factors. ICP Interference Check is performed at the beginning and end of each sample analysis run. Control limits are 80-120% (DoD QSM limits 80-120%).

- All criteria were met. No qualifiers were applied.

V-Laboratory Control Samples (LCS)

The laboratory control sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. All aqueous LCS results must fall within the control limits. The DoD QSM aqueous LCS recovery limits are specified in Table D-18 of the DoD QSM (DoD, 2006). The DoD QSM solid LCS recovery limits are specified in Table D-19 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample MP12581-BS was used as aqueous LCS for ICP metals analysis on 07/26/07. All criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this LCS.

- Sample MP12567-BS was used as solid LCS for ICP metals analysis on 07/25/07. All criteria were met. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), and 59SS09 (F51154-30) apply to this LCS.

- Sample MP12577-BS was used as solid LCS for ICP metals analysis on 07/26/07. All criteria were met. No qualifiers were applied. Samples 59SS10 (F51154-31) and TMSS05 (F51154-32) apply to this LCS.

- Sample MP12560-BS was used as aqueous LCS for mercury analysis performed on 07/25/07. All criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this LCS.

- Sample MP12573-BS was used as solid LCS for mercury analysis on 07/26/07. All criteria were met. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), and 59SS07 (F51154-28) apply to this LCS.

- Sample MP12574-BS was used as solid LCS for mercury analysis on 07/26/07. All criteria were met. No qualifiers were applied. Samples 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this LCS.

VI-Laboratory Duplicate Sample Analysis

Duplicate sample determinations are used to demonstrate acceptable method precision by the laboratory at the time of analysis. Duplicate analyses are also performed to generate data in order to determine the long-term precision of the analytical method on various matrices. RPDs must be within established control limits. DoD QSM limits for metals are 20% RPD for ICP metals and mercury.

- Sample LFSW01 (F51154-17) was used as aqueous laboratory duplicate for ICP metals analysis on 07/27/07. Chromium (200%), manganese (23.7%), nickel (200%), and vanadium (200%) were above criteria. Chromium, manganese, nickel, and vanadium were outside due to low sample concentrations (i.e. <MRL); therefore, no qualifiers were applied based upon this outlier. All other metals were within criteria. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this laboratory duplicate.

- Sample F51150-6 was used as soil laboratory duplicate for ICP metals analysis on 07/25/07. This sample is not a RFAAP site sample; therefore, it was not evaluated. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), and 59SS09 (F51154-30) apply to this laboratory duplicate.

- Sample 59SS10 (F51154-31) was used as solid laboratory duplicate for ICP metals analysis on 07/26/07. Silver (200%) was above criteria. Silver was outside due to low sample concentrations (i.e. <MRL); therefore, no qualifiers were applied based upon this outlier. All other metals were within criteria. No qualifiers were applied. Samples 59SS10 (F51154-31) and TMSS05 (F51154-32) apply to this laboratory duplicate.

- Sample LFSW01 (F51154-17) was used as aqueous laboratory duplicate for mercury analysis on 06/25/07. All criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this laboratory duplicate.

- Sample F51240-2 was used as soil laboratory duplicate for mercury analysis on 07/26/07. This sample is not a RFAAP site sample; therefore, it was not evaluated. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), and 59SS07 (F51154-28) apply to this laboratory duplicate.

- Sample 59SS08 (F51154-29) was used as solid laboratory duplicate for mercury analysis on 07/26/07. All criteria were met. No qualifiers were applied. Samples 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this laboratory duplicate.

VII-Matrix Spike/Spike Duplicate

MS/MSD are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. Specific criteria include the analyses of matrix spike and matrix spike duplicate samples at a frequency of one MS and MSD per 20 samples of similar matrix. MS and MSD recoveries and relative percent differences between MS and MSD recoveries should be within the specified limits. DoD QSM aqueous MS/MSD recovery limits follow the LCS criteria and are specified in Table D-18 of the DoD QSM (DoD, 2006). DoD QSM solid MS/MSD recovery limits follow the LCS criteria and are specified in Table D-19 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used. Post digestion spikes limits are 75-125% for ICP metals and mercury.

- Sample LFSW01 (F51154-17) was used as aqueous laboratory MS/MSD for ICP metals analysis on 07/27/07. All criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this MS/MSD.

- Sample F51150-6 was used as laboratory solid MS/MSD for ICP metals analysis on 07/25/07. This sample is not a RFAAP site sample; therefore, it was not evaluated. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), and 59SS09 (F51154-30) apply to this MS/MSD.

- Sample 59SS10 (F51154-31) was used as solid laboratory MS/MSD for ICP metals analysis on 07/26/07. Aluminum (138%), antimony (17.5%, 12.5%; RPD=31.0%), arsenic (78.4%, 74.5%), cadmium (78.9%), calcium (79.6%), chromium (55.5%, 64.1%), iron (33.9%), manganese (-23%, 1064%; RPD=57.1%), nickel (79.3%), potassium (78.8%, 79.6%), selenium (77.3%, 71.8%), silver (78.9%), sodium (79.7%), thallium (75.9%), and vanadium (75.0%, 75.3%) were outside criteria. The sample concentration was >4 times the spike added for iron and manganese; therefore, no qualifiers were applied based upon these outliers. Antimony, arsenic, cadmium, calcium, chromium, nickel, potassium, selenium, silver, sodium, thallium, and vanadium were qualified bias low "L" for detects and "UL" for non-detects based upon the low recoveries. Aluminum was qualified bias high "K" for detects and no qualifier for non-detects based upon the high recovery. All other metals were within criteria. Samples 59SS10 (F51154-31) and TMSS05 (F51154-32) apply to this MS/MSD.

- Sample LFSW01 (F51154-17) was used as laboratory aqueous MS/MSD for mercury analysis on 06/25/07. All criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this MS/MSD.

- Sample F51240-2 was used as solid MS/MSD for mercury analysis on 07/26/07. This sample is not a RFAAP site sample; therefore, it was not evaluated. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), and 59SS07 (F51154-28) apply to this MS/MSD.

- Sample 59SS08 (F51154-29) was used as solid MS/MSD for mercury analysis on 07/26/07. All criteria were met. No qualifiers were applied. Samples 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this MS/MSD.

VIII-ICP Serial Dilution
An ICP serial dilution is performed to determine whether significant physical or chemical interferences exist due to sample matrix at high concentrations. An analysis of a 5-fold dilution should agree within 10% difference of the original result when the concentration in sample is a factor of 50 above MDL.

- The serial dilution for ICP metals was analyzed on 07/27/07 using aqueous sample LFSW01 (F51154-17). Lead (100%), potassium (147%), sodium (29.7%), and zinc (100%) were outside of criteria limits. Sample concentrations were <50 times MDL for lead, sodium, and zinc; therefore, no qualifiers were applied based upon these outliers. For potassium, all detects were qualified estimated "J" and non-detects no qualifier based upon this outlier. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this serial dilution.

- The serial dilution for total ICP metals was analyzed using solid sample F51150-6 on 07/25/07. This sample is not a RFAAP site sample; therefore, it was not evaluated. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), and 59SS09 (F51154-30) apply to this serial dilution.

- The serial dilution for ICP metals was analyzed on 07/26/07 using solid sample 59SS10 (F51154-31). Antimony (100%), arsenic (15.2%), beryllium (17.9%), calcium (15.4%), chromium (13.5%), cobalt (16.4%), iron (14.5%), lead (19.0%), magnesium (14.3%), manganese (16.5%), nickel (13.5%), potassium (83.6%), selenium (24.4%), sodium (532%), vanadium (11.8%), and zinc (15.6%) were outside of criteria limits. Sample concentrations were <50 times MDL for antimony, beryllium, selenium, and sodium; therefore, no qualifiers were applied based upon these outliers. For arsenic, calcium, chromium, cobalt, iron, lead, magnesium, manganese, nickel, potassium, vanadium, and zinc, all detects were qualified estimated "J" and non-detects no qualifier based upon these outliers. Samples 59SS10 (F51154-31) and TMSS05 (F51154-32) apply to this serial dilution.

- The serial dilution for mercury was analyzed using aqueous sample LFSW01 (F51154-17) on 07/25/07. All criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this serial dilution.

- The serial dilution for mercury was analyzed using solid sample F51240-2 on 07/26/07. This sample is not a RFAAP site sample; therefore, it was not evaluated. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), and 59SS07 (F51154-28) apply to this serial dilution.

- The serial dilution for mercury was analyzed using solid sample 59SS08 (F51154-29) on 07/26/07. Mercury (34.5%) was above criteria. Sample concentration was <50 times MDL for mercury; therefore, no qualifiers were applied based upon this outlier. Samples 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this serial dilution.

IX-Field Duplicate Sample Analysis

Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 35% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field surface water sample duplicate pair LFSW01 (F51154-17) and TMSW01 (F51154-20) was collected for TAL metals. All detected TAL metals found in the sample and its duplicate pair and associated %RPD are noted in **Table 4**. All other TAL metals target compounds were non-detect. Manganese (86.2%) and zinc (69.5%) were above criteria due to low concentration levels detected below the MRL. Manganese and zinc were qualified estimated "J" for the original and duplicate pair samples based upon these outliers. For all other metals, all criteria were met.

Table 4 Field Precision Hits Analysis Summary for TAL Metals for Duplicate Pair LFSW01 (F51154-17) and TMSW01 (F51154-20)

Compound	Original Sample (µg/L)	Duplicate Pair (µg/L)	%RPD
Aluminum	18.0U	50.7J	NA
Lead	3.4U	3.4J	NA
Magnesium	30100	30900	2.6
Manganese	3.3J	8.3J	86.2
Potassium	4320J	4450J	3.0
Sodium	24100	24800	2.9
Barium	103J	108J	4.7
Chromium	0.6U	0.99J	NA
Zinc	7.6J	15.7J	69.5
Calcium	79600	81600	2.5

J = Estimated value <MRL and >MDL. Data point qualified was estimated "J".
U = Non-detect as <MDL.
NA = Not Applicable

- Field sediment sample duplicate pair LFSD01 (F51154-15) and TMSD01 (F51154-16) was collected for TAL metals. All detected TAL metals found in the sample and its duplicate pair and associated %RPD are noted in **Table 5**. All other TAL metals target compounds were non-detect. Barium (49.3%) was above criteria probably due to sample non-homogeneity. Mercury (51.2%) was above criteria due to low concentration levels detected below the MRL. Barium and mercury were qualified estimated "J" for the original and duplicate pair samples based upon these outliers. For all other metals, all criteria were met.

Table 5 Field Precision Hits Analysis Summary for TAL Metals for Duplicate Pair LFSD01 (F51154-15) and TMSD01 (F51154-16)

Compound	Original Sample (mg/kg)	Duplicate Pair (mg/kg)	%RPD
Aluminum	10100	8710	14.8
Iron	29000	23200	22.2
Lead	195	143	30.8
Magnesium	2970	2910	2.0
Nickel	11.7	9.7	18.7
Potassium	1180	996	16.9
Silver	0.076U	0.081J	NA
Sodium	222J	200J	10.4
Antimony	1.8J	1.3J	32.3
Arsenic	3.4	2.9	15.9
Barium	167	101	49.3
Beryllium	1.1	0.94	15.7
Chromium	24.9	18.5	29.5
Cobalt	11.8	9.1	25.8
Copper	22.1	19.9	10.5
Vanadium	28	22	24.0
Calcium	2480	3100	22.2
Selenium	9.6	7.5	24.6
Manganese	1600	1190	29.4
Zinc	682	512	28.5
Mercury	0.076J	0.045J	51.2

J = Estimated value <MRL and >MDL. Data point qualified was estimated "J".
U = Non-detect as <MDL.
NA = Not Applicable

- Field surface soil sample duplicate pair 49SS05 (F51154-26) and TMSS05 (F51154-32) was collected for TAL metals. All detected TAL metals found in the sample and its duplicate pair and associated %RPD are noted in **Table 6**. All other TAL metals target compounds were non-detect. All criteria were met. No qualifiers were applied.

Table 6 Field Precision Hits Analysis Summary for TAL Metals for Duplicate Pair 49SS05 (F51154-26) and TMSS05 (F51154-32)

Compound	Original Sample (mg/kg)	Duplicate Pair (mg/kg)	%RPD
Aluminum	15500	15900	2.6
Iron	17900	18300	2.2
Lead	20.5	20.3	1.0
Magnesium	863	872	1.0
Nickel	7.4	7.9	6.5
Potassium	776	791	1.9
Antimony	0.73J	0.89J	19.8
Arsenic	3.2	3.5	9.0
Barium	69.8	67.0	4.1
Beryllium	0.61	0.59	3.3
Chromium	14.9	17.6	16.6
Cobalt	3.7	4.0	7.8
Copper	12.8	13.0	1.6
Vanadium	37.7	37.6	0.3
Zinc	44.5	46.2	3.8
Calcium	1450	1420	2.1
Selenium	6.4	6.6	3.1
Manganese	358	356	0.6
Mercury	0.072J	0.093J	25.5

J = Estimated value <MRL and >MDL. Data point qualified was estimated "J".

X-Quantitation Verification
The accuracy of analytical results is verified through the calculation of several parameters. The percent difference (%D) between the calculated and the reported values should be within 10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J." The following calculations were performed for verification.

ICP Sample: 41SW08 (F51154-6), Barium

Conc. (µg/L) = (conc. µg/L) *(Final Volume mL) * (DF) / (Volume Sample mL)

Conc. (µg/L) = (64.9 µg/L)*(50 mL)*(1) / (50 mL) = 64.9 µg/L

Reported concentration = 64.9 µg/L
%D = 0.0%
Values were within 10% difference.

CVAA Sample: LFSW01MS (F51154-17MS), Mercury

Conc. (µg/L) = (conc. µg/L) *(Final Volume mL) * (DF) / (Volume Sample mL)

Conc. (µg/L) = (2.95 µg/L)*(50 mL)*(1) / (50 mL) = 3.0 µg/L

Reported concentration = 3.0 µg/L
%D = 0.0%.
Values were within 10% difference.

ICP Sample: 41SD08 (F51154-9), Barium

Conc. (mg/kg) = {(conc. µg/L)*(Final Volume L)*(DF)} / {(Weight Sample g)*(Fraction Solids)}

Conc. (mg/kg) = {(985.6 µg/L)*(0.050 L)*(1)} / {(1.00 g)*(0.3690)} = 134 µg/g = 134 mg/kg

Reported concentration = 134 mg/kg
%D = 0.0%
Values were within 10% difference.

Hg Sample: 41SD08 (F51154-9), Mercury

Conc. (mg/kg) = {(conc. µg/L)*(Final Volume L)*(DF)} / {(Weight Sample g)*(Fraction Solids)}

Conc. (mg/kg) = {(0.471 µg/L)*(0.050 L)*(1)} / {(0.63 g)*(0.3690)} = 0.10 µg/g = 0.10 mg/kg

Reported concentration = 0.10 mg/kg
%D = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

D = Indicates sample was analyzed at a dilution.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

N (Metals) = Laboratory spike sample recovery not within control limits.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Eric Malarek, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Pesticides and PCBs
Accutest Laboratories, Inc., SDG F51154

DATE: September 26, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at Main Manufacturing Area at RFAAP for a RFI/CMS Nine Sites on July 18, 2007 and July 19, 2007. Aqueous samples were analyzed for pesticides and PCBs using USEPA Method 3510C/8081A and 3510C/8082, respectively. Solid samples were analyzed for pesticides and PCBs using USEPA Method 3550B/8081A and 3550B/8082, respectively. A total of five aqueous samples and seventeen solid samples were validated. The sample Ids are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
41SW08	F51154-6	41SD11	F51154-22
41SW09	F51154-7	49SS02	F51154-23
41SW10	F51154-8	49SS03	F51154-24
41SD08	F51154-9	49SS04	F51154-25

TMSW01	F51154-20	TMSS05	F51154-32

Data were reviewed by Eric Malarek and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

RFAAP VALIDATION REPORT
PESTICIDE/PCB REVIEW
SDG F51154

I-Holding Times and Preservation
The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: For aqueous samples, pesticide and PCB compounds are shipped cooled (@4°C ± 2°C) with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis. For solid samples, pesticide and PCB compounds are shipped cooled (@4°C ± 2°C) with a maximum holding time of 14 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: The temperature blank was sent with each cooler and recorded by the laboratory upon receipt. For samples collected on 07/18/07 and 07/19/07, the coolers were received by the primary laboratory (Accutest) on 07/20/07 at 4.0°C, 4.0°C, 4.6°C, 4.6°C, 4.8°C, 5.0°C, 5.0°C, and 5.8°C. The herbicides were subcontracted to Accutest TX and were received the samples at 4.2°C, 4.0°C, and 3.6°C. The perchlorate subcontract laboratory (Datachem Laboratories, Inc.) received the aqueous samples at 3.0°C. The dioxin subcontract laboratory (SGS Paradigm Analytical Laboratories, Inc.) received the samples at 5.5°C and 5.2°C. All criteria were met. No qualifiers were applied.

- Holding Time Review: The aqueous samples were collected on 07/18/07 and 07/19/07. For aqueous samples collected 07/18/07 and 07/19/07, the pesticides and PCBs were extracted on 07/24/07 and analyzed on 07/26/07. For solid samples collected 07/18/07 and 07/19/07, the pesticides were extracted on 07/27/07 and analyzed on 07/31/07, 08/02/07, 08/06/07, and 08/08/07. All criteria were met. No qualifiers were applied.

II-Instrument Performance Check (Degradation Standard)
Performance checks on the gas chromatograph with electron capture detector (GC/ECD) system are performed to ensure adequate resolution and instrument sensitivity. The performance evaluation mixture (PEM) must be analyzed at the beginning of the analytical sequence. The breakdown of Endrin and 4,4'-DDT must be ≤15% on both signals.

- For analysis performed on 07/24/07 @14:31, endrin and 4,4'-DDT percent breakdowns were 10.3% and 9.0% on signal #1 and 10.8% and 7.8% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- For analysis performed on 07/26/07 @11:10, endrin and 4,4'-DDT percent breakdowns were 12.4% and 4.2% on signal #1 and 13.8% and 3.7% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- For analysis performed on 08/01/07 @12:02, endrin and 4,4'-DDT percent breakdowns were 13.7% and 8.0% on signal #1 and 14.5% and 7.7% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- For analysis performed on 08/02/07 @11:19, endrin and 4,4'-DDT percent breakdowns were 13.3% and 7.7% on signal #1 and 14.5% and 7.2% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- For analysis performed on 08/04/07 @09:09, endrin and 4,4'-DDT percent breakdowns were 14.1% and 5.0% on signal #1 and 13.8% and 4.5% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- For analysis performed on 07/13/07 @13:24, endrin and 4,4'-DDT percent breakdowns were 11.8% and 6.5% on signal #1 and 12.0% and 5.6% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- For analysis performed on 07/31/07 @13:54, endrin and 4,4'-DDT percent breakdowns were 10.9% and 11.4% on signal #1 and 10.1% and 9.2% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- For analysis performed on 08/06/07 @09:25, endrin and 4,4'-DDT percent breakdowns were 11.2% and 7.1% on signal #1 and 10.7% and 5.6% on signal #2, respectively. All criteria were met. No qualifiers were applied.

III-Initial Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. The initial 5 point calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run. Calibration factors are generated for each compound. The DoD QSM specifies that the percent relative standard deviation (%RSD) for all single peak target analytes, and aroclors 1016, 1242, 1254, and 1260 must be <20% or the mean %RSD for all analytes in the standard must be ≤20%. If linear regression is used, the correlation coefficient must be ≥0.995. All detects are qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits.

- For the pesticide initial calibration performed on 07/24/07 on instrument ECD5, all criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) were analyzed using this initial calibration.

- For the pesticide initial calibration performed on 08/01/07 on instrument ECD5, all criteria were met. No qualifiers were applied. Samples LFSD01 (F51154-15), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), and TMSS05 (F51154-32) were analyzed using this initial calibration.

- For the pesticide initial calibration performed on 08/04/07 on instrument ECD5, all criteria were met. No qualifiers were applied. Samples TMSD01 (F51154-16), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), and 59SS10 (F51154-31) were analyzed using this initial calibration.

- For the pesticide initial calibration performed on 07/13/07 on instrument ECD6, all criteria were met. No qualifiers were applied. Samples LFSD01 (F51154-15), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS05 (F51154-26), and TMSS05 (F51154-32) were analyzed using this initial calibration.

- For the pesticide initial calibration performed on 08/06/07 on instrument ECD6, all criteria were met. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), 49SS04 (F51154-25), 59SS06 (F51154-27), 59SS07 (F51154-28), and 59SS08 (F51154-29), 59SS09 (F51154-30), and 59SS10 (F51154-31) were analyzed using this initial calibration.

- For the PCB initial calibration performed on 07/28/07 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) were analyzed using this initial calibration.

- For the PCB initial calibration performed on 07/26/07 on instrument ECD7, all criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) were analyzed using this initial calibration.

- For the PCB initial calibration performed on 08/02/07 on instrument ECD7, all criteria were met. No qualifiers were applied. Sample 49SS02 (F51154-23) was analyzed using this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for pesticide/PCB target compounds. Continuing calibration standards containing both target compounds and surrogates are analyzed at the beginning of each 12-hour analytical shift and after every 20 samples. The DoD QSM specifies that the percent difference (%D) or the average %Ds for all analytes in the standard from the initial calibration should be no greater than ±20%.

- For pesticide initial calibration verification performed on 07/24/07 @17:08 on instrument ECD5, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this initial calibration verification.

- For pesticide continuing calibration performed on 07/26/07 @15:31 on instrument ECD5, all criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) were analyzed using this continuing calibration.

- For pesticide continuing calibration performed on 07/26/07 @19:00 on instrument ECD5, endrin (25.4%) was outside criteria for the signal #1. Endrin (24.4%) was outside criteria for the signal #2. Endrin was non-detect for all associated samples; therefore, no qualifiers were applied based upon these outliers. No samples reported were analyzed using this continuing calibration.

- For pesticide initial calibration verification performed on 08/01/07 @15:15 on instrument ECD5, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this initial calibration verification.

- For pesticide continuing calibration performed on 08/02/07 @14:21 on instrument ECD5, all criteria were met for signal #1 and for the signal #2. No qualifiers were applied. Samples LFSD01 (F51154-15), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), and TMSS05 (F51154-32) were analyzed using this continuing calibration.

- For pesticide continuing calibration performed on 08/02/07 @17:22 on instrument ECD5, 4,4'-DDT (23.5%) was outside criteria for the signal #1. 4,4'-DDT (24.1%) was outside criteria for the signal #2. 4,4'-DDT was non-detect for all associated samples; therefore, no qualifiers were applied based upon these outliers. No samples reported were analyzed using this continuing calibration.

- For pesticide initial calibration verification performed on 08/04/07 @12:47 on instrument ECD5, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this initial calibration verification.

- For pesticide continuing calibration performed on 08/08/07 @13:34 on instrument ECD5, all criteria were met for signal #1 and for the signal #2. No qualifiers were applied. Sample TMSD01 (F51154-16) was analyzed using this continuing calibration.

- For pesticide continuing calibration performed on 08/08/07 @14:59 on instrument ECD5, all criteria were met for signal #1 and for the signal #2. No qualifiers were applied. Samples TMSD01 (F51154-16), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), and 59SS10 (F51154-31) were analyzed using this continuing calibration.

- For pesticide continuing calibration performed on 08/08/07 @17:30 on instrument ECD5, heptachlor (30.4%), 4,4'-DDD (22.4%), 4,4'-DDT (87.0%; grossly exceeding), methoxychlor (82.0%; grossly exceeding), and endrin ketone (29.8%) were outside criteria for the signal #1. Heptachlor (31.3%), 4,4'-DDD (26.7%), 4,4'-DDT (88.2%; grossly exceeding), methoxychlor (83.0%; grossly exceeding), and endrin ketone (33.5%) were outside criteria for the signal #2. No samples reported was analyzed using this continuing calibration; therefore, no qualifiers were applied based upon these outliers.

- For pesticide initial calibration verification performed on 07/13/07 @15:47 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this initial calibration verification.

- For pesticide continuing calibration performed on 07/31/07 @14:52 on instrument ECD6, all criteria were met for signal #1. 4,4'-DDT (25.4%) was outside criteria for the signal #2. 4,4'-DDT was non-detect for all associated samples; therefore, no qualifiers were applied based upon these outliers. Samples LFSD01 (F51154-15), APSD01 (F51154-18), 41SD11 (F51154-22), and 49SS02 (F51154-23) were analyzed using this continuing calibration.

- For toxaphene pesticide continuing calibration performed on 07/31/07 @15:08 on instrument ECD6, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For chlordane pesticide continuing calibration performed on 07/31/07 @15:24 on instrument ECD6, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For pesticide continuing calibration performed on 07/31/07 @18:23 on instrument ECD6, 4,4'-DDT (65.7%; grossly exceeding) and methoxychlor (53.6%; grossly exceeding) were outside criteria for the signal #1. 4,4'-DDT (69.1%; grossly exceeding) and methoxychlor (57.7%; grossly exceeding) were outside criteria for the signal #2. 4,4'-DDT and methoxychlor were qualified estimated "UJ" for non-detects based upon the very high %Ds. Samples 49SS03 (F51154-24), 49SS05 (F51154-26), and TMSS05 (F51154-32) were analyzed using this continuing calibration.

- For pesticide continuing calibration performed on 07/31/07 @19:42 on instrument ECD6, 4,4'-DDT (64.5%; grossly exceeding) and methoxychlor (53.9%; grossly exceeding) were outside criteria for the signal #1. 4,4'-DDT (67.9%; grossly exceeding) and methoxychlor (56.8%; grossly exceeding) were outside criteria for the signal #2. 4,4'-DDT and methoxychlor were qualified estimated "UJ" for non-detects based upon the very high %Ds. No samples reported were analyzed using this continuing calibration.

- For pesticide initial calibration verification performed on 08/06/07 @12:29 on instrument ECD6, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this initial calibration verification.

- For pesticide continuing calibration performed on 08/06/07 @15:35 on instrument ECD6, all criteria were met. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), 49SS04 (F51154-25), 59SS06 (F51154-27), 59SS07 (F51154-28), and 59SS08 (F51154-29) were analyzed using this continuing calibration.

- For pesticide continuing calibration performed on 08/06/07 @18:29 on instrument ECD6, 4,4'-DDT (47.6%; grossly exceeding) and methoxychlor (43.5%; grossly exceeding) were outside criteria for the signal #1. 4,4'-DDT (45.2%; grossly exceeding) and methoxychlor (43.0%; grossly exceeding) were outside criteria for the signal #2. 4,4'-DDT and methoxychlor were qualified estimated "UJ" for non-detects based upon the very high %Ds. Samples 59SS09 (F51154-30) and 59SS10 (F51154-31) were analyzed using this continuing calibration.

- For pesticide continuing calibration performed on 08/06/07 @19:32 on instrument ECD6, 4,4'-DDD (20.6%), 4,4'-DDT (51.2%; grossly exceeding), and methoxychlor (43.4%; grossly exceeding) were outside criteria for the signal #1. 4,4'-DDD (21.0%), 4,4'-DDT (67.9%; grossly exceeding), and methoxychlor (56.8%; grossly exceeding) were outside criteria for the signal #2. 4,4'-DDT and methoxychlor were qualified estimated "UJ" for non-detects based upon the very high %Ds. 4,4'-DDD was non-detect for all associated samples; therefore, no qualifiers were applied based upon these outliers. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), and 49SS04 (F51154-25) were analyzed using this continuing calibration.

- For pesticide continuing calibration performed on 08/06/07 @22:42 on instrument ECD6, heptachlor (37.9%), 4,4'-DDD (30.8%), 4,4'-DDT (95.2%; grossly exceeding), methoxychlor (89.2%; grossly exceeding), and endrin ketone (50.6%; grossly exceeding) were outside criteria for the signal #1. Heptachlor (36.0%), 4,4'-DDE (21.1%), 4,4'-DDD (56.2%; grossly exceeding), 4,4'-DDT (88.8%; grossly exceeding), methoxychlor (80.5%; grossly exceeding), and endrin ketone (47.3%; grossly exceeding) were outside criteria for the signal #2. 4,4'-DDD, 4,4'-DDT, methoxychlor, and endrin ketone were qualified estimated "J" for detects and "UJ" for non-detects based upon the very high %Ds. Heptachlor and 4,4'-DDE were non-detect for all associated samples; therefore, no qualifiers were applied based upon these outliers. No samples reported were analyzed using this continuing calibration.

- For PCB 1016/1260 initial calibration verification performed on 07/28/07 @14:59 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this initial calibration verification.

- For PCB 1016/1260 continuing calibration performed on 07/31/07 @09:51 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), and 41SD11 (F51154-22) were analyzed using this continuing calibration.

- For PCB 1248 continuing calibration performed on 07/31/07 @10:13 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For PCB 1242 continuing calibration performed on 07/31/07 @10:30 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For PCB 1232/1268 continuing calibration performed on 07/31/07 @10:47 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For PCB 1221/1254 continuing calibration performed on 07/31/07 @11:04 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For PCB 1016/1260 continuing calibration performed on 07/31/07 @14:29 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), and 59SS10 (F51154-31) were analyzed using this continuing calibration.

- For PCB 1016/1260 continuing calibration performed on 07/31/07 @17:54 on instrument ECD3, all criteria were met. No qualifiers were applied. Sample TMSS05 (F51154-32) was analyzed using this continuing calibration.

- For PCB 1016/1260 continuing calibration performed on 07/31/07 @18:45 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For PCB 1016/1260 continuing calibration performed on 08/01/07 @09:49 on instrument ECD3, all criteria were met. No qualifiers were applied. Sample 49SS03 (F51154-24) was analyzed using this continuing calibration.

- For PCB 1248 continuing calibration performed on 08/01/07 @10:06 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For PCB 1242 continuing calibration performed on 08/01/07 @10:23 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For PCB 1232/1268 continuing calibration performed on 08/01/07 @10:44 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For PCB 1221/1254 continuing calibration performed on 08/01/07 @11:01 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For PCB 1016/1260 continuing calibration performed on 08/01/07 @13:56 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For PCB 1016/1260 initial calibration verification performed on 07/26/07 @13:51 on instrument ECD7, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this initial calibration verification.

- For PCB 1016/1260 continuing calibration performed on 07/26/07 @18:39 on instrument ECD7, PCB1016-A (28.0%) was outside criteria for signal #1; however, the average %D for PCB1016 was 12.4%. PCB1016-A (40.6%), PCB1016-B (29.9%), and PCB1016-F (22.8%) were outside criteria for signal #2. The average %D for PCB1016 was 20.9% for signal #2. PCB 1016 was non-detect for all associated samples and was qualified estimated "UJ" for non-detects based upon the high %D. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) were analyzed using this continuing calibration.

- For PCB 1016/1260 continuing calibration performed on 07/26/07 @21:45 on instrument ECD7, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For PCB 1016/1260 initial calibration verification performed on 08/02/07 @13:41 on instrument ECD7, all criteria were met. No qualifiers were applied. Sample 49SS02 (F51154-23) was analyzed using this initial calibration verification.

- For PCB 1016/1260 continuing calibration performed on 08/02/07 @16:48 on instrument ECD7, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

V-Blank Analysis

The purpose of laboratory or field blank analyses is to determine the existence and magnitude of contamination problems resulting from laboratory or field activities. One method blank per analytical batch must be run on each instrument used to analyze samples. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤5 times (5X) the maximum amount for pesticide and PCB target compounds. **Table 2** summarizes the blank contamination analysis. Action levels are based upon dilution factor of one and for solid matrices were converted to soil values (soil conversion factor = 33) if needed. Rinse blank RB083007 (F52208-1) (low-flow pump) applies to the groundwater "GW" samples in this SDG. The surface water "SW" samples were collected directly into the laboratory bottles; therefore, no rinse blank applies for the SW samples. Rinse blanks 072407R (F51275-1) and 072507R (F51300-31) apply to the surface soil "SS" and subsurface soil "SB" samples in this SDG. Rinse blank RB071807 (F51154-12) applies to the sediment "SD" samples in this SDG.

Table 2 Blank Contamination Analysis Summary

Parameter	Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
Pesticides	07/26/07	OP21578-MB	All target <½MRL	NA	NA	None
Pesticides	09/24/07	RB083007	All target <½MRL	NA	NA	None
PCBs	06/27/07	OP21577-MB	All target <½MRL	NA	NA	None
PCBs	09/14/07	RB083007	All target <½MRL	NA	NA	None
Parameter	**Analysis Date**	**QC Blank ID**	**Compound**	**Max Conc. µg/kg**	**Action Level µg/kg**	**B qualified samples**
Pesticides	07/31/07	OP21640-MB	All target <½MRL	NA	NA	None
Pesticides	08/02/07	OP21640-MB	All target <½MRL	NA	NA	None
Pesticides	08/06/07	OP21640-MB	All target <½MRL	NA	NA	None
Pesticides	08/08/07	OP21640-MB	All target <½MRL	NA	NA	None
Pesticides	07/02/07	RB071807	All target <½MRL	NA	NA	None
Pesticides	07/02/07	072407R	All target <½MRL	NA	NA	None
Pesticides	07/02/07	072507R	All target <½MRL	NA	NA	None
PCBs	07/26/07	OP21641-MB	All target <½MRL	NA	NA	None
PCBs	07/27/07	OP21641-MB	All target <½MRL	NA	NA	None
PCBs	07/27/07	OP21641-MB	All target <½MRL	NA	NA	None
PCBs	06/27/07	RB071807	All target <½MRL	NA	NA	None
PCBs	06/27/07	072407R	All target <½MRL	NA	NA	None
PCBs	06/27/07	072507R	All target <½MRL	NA	NA	None

NA = Not Applicable
MRL = Method Reporting Limit

VI-System Monitoring Compound (Surrogates)
Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Surrogate spikes are added to all samples and blanks to measure their recovery in sample and blank matrices. The percent recoveries (%Rs) must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Criteria:	Tetrachloro-m-xylene:	Pesticides: 42-127% (DoD QSM 25-140%)
	Decachlorobiphenyl:	Pesticides: 27-127% (DoD QSM 30-135%)
Aqueous Criteria:	Tetrachloro-m-xylene:	PCBs: 38-127% (DoD QSM Not Listed)
	Decachlorobiphenyl:	PCBs: 25-137% (DoD QSM 40-135%)
Solid Criteria:	Tetrachloro-m-xylene:	Pesticides: 46-122% (DoD QSM 70-125%)
	Decachlorobiphenyl:	Pesticides: 50-133% (DoD QSM 55-130%)
Solid Criteria:	Tetrachloro-m-xylene:	PCBs: 44-126% (DoD QSM Not Listed)
	Decachlorobiphenyl:	PCBs: 39-157% (DoD QSM 60-125%)

- For pesticides sample 41SD10 (F51154-11), all criteria were met for the original run. For the confirmation, tetrachloro-m-xylene (69.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier for run #2.

- For pesticides sample TMSD01 (F51154-16), tetrachloro-m-xylene (50.0%) and decachlorobiphenyl (37.0%) were outside criteria. All detects were qualified "L" and non-detects "UL" based upon the low recoveries. Sample was re-analyzed for confirmation (run #2). For the confirmation, tetrachloro-m-xylene (62.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier for run #2.

- For pesticides sample 41SD11 (F51154-22), tetrachloro-m-xylene (69.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier. Sample was re-analyzed for confirmation (run #2). For the confirmation, tetrachloro-m-xylene (65.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier for run #2.

- For pesticides sample 49SS02 (F51154-23), tetrachloro-m-xylene (53.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier. Sample was re-analyzed for confirmation (run #2). For the confirmation, tetrachloro-m-xylene (51.0%) and decachlorobiphenyl (48.0%) were outside criteria. All detects were qualified "L" and non-detects "UL" based upon the low recoveries for run #2.

- For pesticides sample 49SS03 (F51154-24), tetrachloro-m-xylene (64.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier. For the confirmation, tetrachloro-m-xylene (62.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier for run #2.

- For pesticides sample 59SS07 (F51154-28), all criteria were met for the original run. For the confirmation, tetrachloro-m-xylene (67.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier for run #2.

- For pesticides sample 59SS09 (F51154-30), tetrachloro-m-xylene (66.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier. Sample was re-analyzed for confirmation (run #2). For the confirmation, tetrachloro-m-xylene (69.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier for run #2.

- For pesticides sample 59SS10 (F51154-31), tetrachloro-m-xylene (55.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier. Sample was re-analyzed for confirmation (run #2). For the confirmation, all criteria were met.

- For pesticides sample TMSS05 (F51154-32), all criteria were met for the original run. For the confirmation, tetrachloro-m-xylene (69.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier for run #2.

- For PCBs sample 41SD08 (F51154-9), decachlorobiphenyl (57.0%) was below DoD QSM criteria and within laboratory criteria. Tetrachloro-m-xylene was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For PCBs sample 41SD10 (F51154-11), decachlorobiphenyl (56.0%) was below DoD QSM criteria and within laboratory criteria. Tetrachloro-m-xylene was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For PCBs sample LFSD01 (F51154-15), decachlorobiphenyl (48.0%) was below DoD QSM criteria and within laboratory criteria. Tetrachloro-m-xylene was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For PCBs sample TMSD01 (F51154-16), decachlorobiphenyl (59.0%) was below DoD QSM criteria and within laboratory criteria. Tetrachloro-m-xylene was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For PCBs sample 59SS06 (F51154-27), decachlorobiphenyl (59.0%) was below DoD QSM criteria and within laboratory criteria. Tetrachloro-m-xylene was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For PCBs sample 59SS07 (F51154-28), decachlorobiphenyl (59.0%) was below DoD QSM criteria and within laboratory criteria. Tetrachloro-m-xylene was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For all other samples, all criteria were met for pesticides and PCBs analysis.

VII-Laboratory Control Samples
Laboratory control samples (LCS) are used to monitor laboratory accuracy by calculating the percent recoveries of the spiked compounds. All LCS percent recoveries must be within the specified control limits. DoD QSM aqueous LCS recovery limits are specified in Table D-14 and Table D-16 of the DoD QSM (DoD, 2006). DoD QSM solid LCS recovery limits are specified in Table D-15 and Table D-17 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP21578-BS was used as the aqueous LCS for the pesticide analysis on 07/26/07. Compound endrin aldehyde (12%) was outside DoD QSM criteria, however within laboratory criteria. Compound endrin aldehyde was non-detect for all associated samples and was qualified estimated bias "UL" for non-detects based upon very low recovery. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this LCS.

- Sample OP21640-BS was used as the solid LCS for the pesticide analysis on 07/31/07. Compound endrin aldehyde (8%) was outside DoD QSM criteria, however within laboratory criteria. Compound endrin aldehyde was non-detect for all associated samples and was qualified estimated bias "UL" for non-detects based upon very low recovery. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this LCS.

- Sample OP21577-BS was used as the aqueous LCS for the PCB analysis on 07/26/07. All criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this LCS.

- Sample OP21641-BS was used as the solid LCS for the PCB analysis on 07/31/07. All criteria were met. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this LCS.

VIII-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD aqueous MS/MSD recovery limits follow the LCS criteria and are specified in Table D-14 and Table D-16 of the DoD QSM (DoD, 2006). DoD solid MS/MSD recovery limits follow the LCS criteria and are specified in Table D-15 and Table D-17 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample LFSW01 (F51154-17) was used as the MS/MSD for the pesticide analysis on 07/26/07. Compound endrin aldehyde (21%, 15%) was outside DoD QSM criteria, however within laboratory criteria. The LCS was also low in recovery (See Section VII). Compound endrin aldehyde was non-detect for all samples and qualified estimated bias low "UL" for non-detects for the spiked sample based upon very low recoveries. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this MS/MSD.

- Sample LFSW01 (F51154-17) was used as the MS/MSD for the PCB analysis on 07/26/07. All criteria were met. No qualifiers were applied. Samples 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), LFSW01 (F51154-17), and TMSW01 (F51154-20) apply to this MS/MSD.

- Sample 49SS04 (F51154-25) was used as the MS/MSD for the pesticide analysis on 08/06/07. Compounds delta-BHC (RPD=56%), alpha chlordane (72%), gamma chlordane (74%), dieldrin (70%), 4,4'-DDE (72%), 4,4'-DDT (48%, 0%; RPD=200%), endrin (70%), endosulfan sulfate (0%, RPD=200%), endrin aldehyde (0%, 0%), endrin ketone (62%), endosulfan II (70%), and methoxychlor (60%, 44%, RPD=29%) were outside DoD QSM criteria and/or laboratory criteria. The LCS was also low in recovery (See Section VII). Compounds 4,4'-DDT, endosulfan sulfate, and endrin aldehyde were rejected for the spiked sample based upon no recovery found. Compounds alpha chlordane, gamma chlordane, dieldrin, 4,4'-DDE, endrin, endrin ketone, endosulfan II, and methoxychlor were non-detect for the spiked sample and qualified estimated bias low "UL" for non-detects based upon low recoveries. Delta-BHC was qualified "UJ" for the spiked sample based upon the high RPD. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this MS/MSD.

- Sample 59SS06 (F51154-27) was used as the MS/MSD for the PCB analysis on 07/31/07. All criteria were met. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this MS/MSD.

IX-Field Duplicate Sample Analysis

Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field surface water sample duplicate pair LFSW01 (F51154-17) and TMSW01 (F51154-20) was collected for chlorinated pesticides and PCBs. All chlorinated pesticides and PCBs target compounds were non-detect. All criteria were met. No qualifiers were applied.

- Field surface soil sample duplicate pair 49SS05 (F51154-26) and TMSS05 (F51154-32) was collected for chlorinated pesticides and PCBs. All chlorinated pesticides and PCBs target compounds were non-detect, except for Aroclor 1254. PCB 1254 was detected at 41.1 µg/kg in the original sample and 75.6 µg/kg in the duplicate pair resulting in a RPD of 59.1%. PCB 1254 was qualified estimated "J" for the duplicate pair based upon the high RPD.

- Field sediment sample duplicate pair LFSD01 (F51154-15) and TMSD01 (F51154-16) was collected for chlorinated pesticides and PCBs. All detected chlorinated pesticides and PCBs target compounds found in the sample and its duplicate pair and associated %RPD are noted in **Table 3**. All other chlorinated pesticides and PCBs target compounds were non-detect. alpha-Chlordane (88.4%), gamma-Chlordane (70.7%), and Aroclor 1260 (58.1%) were above criteria due to low concentration levels detected below the MRL and/or matrix effects. alpha-Chlordane, gamma-chlordane, and aroclor 1260 were qualified estimated "J" for the original and duplicate pair samples based upon these outliers. For all other compounds, all criteria were met.

Table 3 Field Precision Hits Analysis Summary for Chlorinated Pesticides and PCBs for Duplicate Pair LFSD01 (F51154-15) and TMSD01 (F51154-16)

Compound	Original Sample (µg/kg)	Duplicate Pair (µg/kg)	%RPD
Heptachlor epoxide	14U	1.7J	NA
alpha-Chlordane	13.7J	5.3	88.4
gamma-Chlordane	13.6J	6.5	70.7
Aroclor 1260	135	74.2	58.1

J = Estimated value <MRL and >MDL.
U = Non-detect as <MRL.
NA = Not Applicable

X-Quantitation Verification

The accuracy of analytical results was verified through the calculation of several parameters. The difference between the calculated value and the reported value must be within 10% difference. All positive values must have less than or equal to 40% %D between the primary and secondary columns. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J." All criteria were met.

- For sample 59SS07 (F51154-28), dieldrin (86.8%) and heptachlor epoxide (57.4%) were outside criteria. All other target compounds were within criteria. Dieldrin and heptachlor epoxide were qualified estimated "J" based upon the high %Ds.

- For sample 59SS08 (F51154-29), dieldrin (114%) and 4,4'-DDD (82.4%) were outside criteria. All other target compounds were within criteria. Dieldrin and 4,4'-DDD were qualified estimated "J" based upon the high %Ds.

- For all other samples with detected chlorinated pesticides and PCBs, the %D (average %D for multi-peak compounds) between the primary and secondary columns was within criteria.

Sample: LFSW01MS (F51154-17MS), alpha-chlordane

Conc. µg/L = (Amt * DF * Vt) / (CF * Vo)

where: Amt is the response on column (ng/mL) of the sample
CF = Calibration Factor (from initial calibration)
Vt is the volume of final extract (mL)
DF is the dilution factor
Vo is the volume of the sample extracted (mL)

Conc. µg/L = (9068815 ng/mL * 1 * 10 mL) / (212100 * 430 mL)
= 0.99 ng/mL = 0.99 µg/L

Reported Conc. = 0.99 µg/L
%D = 0.0%
Values were within 10% difference

Sample: **LFSW01MS (F51154-17MS), Aroclor 1260**

Conc. µg/L = (Ax * Vt * DF) / (CF * Vi * Vs)

where: Conc. = Sample concentration in µg/L
Ax = Area/response for compound being measured.
Vt = Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10000 µL.
CF = Ave calibration response factor for compound being measured from ICAL (Area/pg)
Vi = Volume of extract injected (µL).
Vs = Volume of sample extracted (L).
DF = Dilution factor

Signal #1
Conc1 µg/L = (1118429 * 10000* 1) / (3120 *(1000000) * 1 * 0.44) = 8.15 µg/L
Conc2 µg/L = (1273241 * 10000* 1) / (3552 *(1000000) * 1 * 0.44) = 8.15 µg/L
Conc3 µg/L = (1179335 * 10000* 1) / (3200 *(1000000) * 1 * 0.44) = 8.38 µg/L
Conc4 µg/L = (944050 * 10000* 1) / (2782 *(1000000) * 1 * 0.44) = 8.07 µg/L
Conc5 µg/L = (2049224 * 10000* 1) / (5769 *(1000000) * 1 * 0.44) = 7.66 µg/L
Conc6 µg/L = (772955 * 10000* 1) / (2276 *(1000000) * 1 * 0.44) = 7.72 µg/L
Average concentration = 8.0 µg/L

Signal #2
Conc1 µg/L = (689475 * 10000* 1) / (1917 *(1000000) * 1 * 0.44) = 8.17 µg/L
Conc2 µg/L = (800449 * 10000* 1) / (2172 *(1000000) * 1 * 0.44) = 8.38 µg/L
Conc3 µg/L = (772763 * 10000* 1) / (2088 *(1000000) * 1 * 0.44) = 8.41 µg/L
Conc4 µg/L = (589063 * 10000* 1) / (1698 *(1000000) * 1 * 0.44) = 7.88 µg/L
Conc5 µg/L = (1340728 * 10000* 1) / (3820 *(1000000) * 1 * 0.44) = 7.98 µg/L
Conc6 µg/L = (504915 * 10000* 1) / (1482 *(1000000) * 1 * 0.44) = 7.74 µg/L
Average concentration = 8.1 µg/L

Reported Value = 8.0 µg/L (from signal #1)
% Difference = 0.0%
Values were within 10% difference.

Sample: LFSD01 (F51154-15), alpha-chlordane

Conc. µg/kg = (Ax * Vt * DF) / (CF * Vi * Ws * D)

where: Conc. = Sample concentration in µg/kg
Ax = Area/response for compound being measured.
Vt = Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10000 µL.
CF = Ave calibration response factor for compound being measured from ICAL (Area/pg)
Vi = Volume of extract injected (mL).
W(s) = Weight of sample extracted or diluted in grams.
D = Percent dry weight (100 - % moisture in sample)/100 = 1.0 for Wet Weight
DF = Dilution factor

Conc. µg/kg = (166174 Area*10000µL*5) / (34180 Area/pg*(1000 pg/ng)*1 µL*30.7g*0.5790) = 13.7 µg/kg

Reported Value = 13.7 µg/kg
% Difference = 0.0%
Values were within 10% difference

Sample: 49SS03 (F51154-24), Aroclor 1260

Conc. µg/kg = (Ax * Vt * DF) / (CF * Vi * Ws * D)

where: Conc. = Sample concentration in µg/kg
Ax = Area/response for compound being measured.
Vt = Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10000 µL.
CF = Ave calibration response factor for compound being measured from ICAL (Area/pg)
Vi = Volume of extract injected (µL).
W(s) = Weight of sample extracted or diluted in grams.
D = Percent dry weight (100 - % moisture in sample)/100 = 1.0 for Wet Weight
DF = Dilution factor

Signal #1
Conc1 µg/kg = (0*10000*2) / (8040*(1000)*1*29.9*0.9200) = 0.00 µg/kg
Conc2 µg/kg = (0*10000*2) / (9920*(1000)*1*29.9*0.9200) = 0.00 µg/kg
Conc3 µg/kg = (0*10000*2) / (9980*(1000)*1*29.9*0.9200) = 0.00 µg/kg
Conc4 µg/kg = (685577*10000*2) / (7129*(1000)*1*29.9*0.9200) = 69.92 µg/kg
Conc5 µg/kg = (1484623*10000*2) / (16390*(1000)*1*29.9*0.9200) = 65.86 µg/kg
Conc6 µg/kg = (1094850*10000*2) / (9500*(1000)*1*29.9*0.9200) = 83.79 µg/kg
Average concentration = 73.2 µg/kg (Peaks 4 → 6)

Signal #2
Conc1 µg/kg = (0*10000*2) / (1276*(1000)*1*29.9*0.9200) = 0.00 µg/kg
Conc2 µg/kg = (0*10000*2) / (1547*(1000)*1*29.9*0.9200) = 0.00 µg/kg
Conc3 µg/kg = (0*10000*2) / (1420*(1000)*1*29.9*0.9200) = 0.00 µg/kg
Conc4 µg/kg = (171305*10000*2) / (1103*(1000)*1*29.9*0.9200) = 112.92 µg/kg
Conc5 µg/kg = (238470*10000*2) / (2556*(1000)*1*29.9*0.9200) = 67.83 µg/kg
Conc6 µg/kg = (141537*10000*2) / (1028*(1000)*1*29.9*0.9200) = 100.10 µg/kg
Average concentration = 93.6 µg/kg (Peaks 4 → 6)

Reported Value = 73.2 µg/kg (signal #1)
% Difference = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

N (Metals) = Laboratory spike sample recovery not within control limits.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Eric Malarek, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Semi-Volatiles & Polynuclear Aromatic Hydrocarbons Accutest Laboratories, Inc., SDG F51154

DATE: September 25, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at Main Manufacturing Area at RFAAP for a RFI/CMS Nine Sites on July 18, 2007 and July 19, 2007. Samples were analyzed for semivolatile organic compounds (SVOCs) using USEPA SW846 Methods 3510C/8270C for aqueous matrices and USEPA SW846 Methods 3550B/8270C for solid matrices. The polynuclear aromatic hydrocarbons (PAHs) were analyzed using selective ion monitoring (SIM) techniques. A total of seven aqueous samples and nineteen solid samples were validated. The sample Ids are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID

AOSW02	F51154-2	APSD01	F51154-18
TMSW01	F51154-3	41SD11	F51154-22
AOSD01	F51154-4	49SS02	F51154-23
AOSD02	F51154-5	49SS03	F51154-24
41SW08	F51154-6	49SS04	F51154-25
41SW09	F51154-7	49SS05	F51154-26
41SW10	F51154-8	59SS06	F51154-27
41SD08	F51154-9	59SS07	F51154-28
41SD09	F51154-10	59SS08	F51154-29
41SD10	F51154-11	59SS09	F51154-30
LFSD01	F51154-15	59SS10	F51154-31
TMSD01	F51154-16	TMSS05	F51154-32

Data were reviewed by Eric Malarek and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Instrument Performance Check
	X	Initial Calibration
	X	Continuing Calibration
	X	Blank Analysis
	X	Surrogate Spikes
	X	Internal Standards
X		Laboratory Control Sample
X		Matrix Spike/Spike Duplicate
X		Field Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications, except for the following. Benzoic acid was qualified rejected "R" for samples AOSW01 (F51154-1), AOSW02 (F51154-2), TMSW01 (F51154-3), 41SW08 (F51154-6), 41SW09 (F51154-7), and 41SW10 (F51154-8) based upon the grossly low (i.e. <10% recovery) found in the associated LCS (see Section VIII).

RFAAP VALIDATION REPORT
SEMIVOLATILES AND PAH REVIEW
SDG F51154

I-Holding Times and Preservation

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: For semivolatile (SVOC) and polynuclear aromatic hydrocarbons (PAH) compounds , the samples are cooled @4°C ± 2°C for aqueous samples with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis. For solid matrices, the samples are cooled @4°C ± 2°C with a maximum holding time of 14 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: The temperature blank was sent with each cooler and recorded by the laboratory upon receipt. For samples collected on 07/18/07 and 07/19/07, the coolers were received by the primary laboratory (Accutest) on 07/20/07 at 4.0°C, 4.0°C, 4.6°C, 4.6°C, 4.8°C, 5.0°C, 5.0°C, and 5.8°C. The herbicides were subcontracted to Accutest TX and were received the samples at 4.2°C, 4.0°C, and 3.6°C. The perchlorate subcontract laboratory (Datachem Laboratories, Inc.) received the aqueous samples at 3.0°C. The dioxin subcontract laboratory (SGS Paradigm Analytical Laboratories, Inc.) received the samples at 5.5°C and 5.2°C. All criteria were met. No qualifiers were applied.

- Holding Time Review: The aqueous samples were collected on 07/18/07 and 07/19/07. For the surface water samples collected 07/18/07 and 07/19/07, the SVOCs were extracted on 07/24/07 and 07/26/07 and analyzed on 07/31/07. For the surface water samples collected 07/18/07 and 07/19/07, the PAHs by SIM were extracted on 07/24/07 and 07/26/07 and analyzed on 07/30/07 and 07/31/07. For the sediment and soil samples collected 07/18/07 and 07/19/07, the SVOCs were extracted on 07/25/07, 07/27/07, and 08/06/07 (49SS03 (F51154-24) confirmation) and analyzed on 07/26/07, 07/30/07, and 08/06/07 (49SS03 (F51154-24) confirmation). Sample 49SS03 (F51154-24) was re-extracted and re-analyzed for confirmation out of holding time for compound di-n-butylphthalate; however, the original sample was reported. No qualifiers were applied based upon this outlier. For the sediment and soil samples collected 07/18/07 and 07/19/07, the PAHs by SIM were extracted on 07/27/07 and analyzed on 07/27/07, 07/31/07, and 08/01/07. Sample collection dates may be found on the attached form 1s. All criteria were met. No qualifiers were applied.

II-Instrument Performance Check

GC/MS instrument performance checks are performed to ensure mass resolution, identification and, to some degree, sensitivity. The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed.

- The instrument performance check, decafluorotriphenylphosphine (DFTPP), met the ion abundance criteria. No qualification was applied.

III-Initial Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for compounds on the semivolatile target compound list (TCL). Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. For compounds analyzed using linear regression or second order, correlation coefficients must be >0.995 and coefficients of determination >0.99. The minimum relative response factor (RRF) criteria must be ≥0.05. The DoD QSM specifies that the initial calibration percent relative standard deviation (%RSD) must be ≤15% on the average for all compounds (<30% for CCCs). All detects are qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- Initial calibration for the SVOCs was performed on 07/05/07 on instrument MSBNA02. Target compounds 2,4-dinitrophenol (19.7%) and 4,6-dinitro-2-methylphenol (25.9%) were outside criteria. All other target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). Compounds 2,4-dinitrophenol (r=0.9950) and 4,6-dinitro-2-methylphenol (r=0.9975) were quantified using linear or second order regression with correlation coefficients >0.995, therefore, no qualifiers were applied based upon the high %RSDs. Sample LFSW01 (F51154-17) was analyzed using this initial calibration.

- Initial calibration for the SVOCs was performed on 07/23/07 on instrument MSBNA03. Target compounds 2,4-dinitrophenol (49.6%; grossly exceeding) and 4,6-dinitro-2-methylphenol (32.7%; grossly exceeding) were outside criteria. All other target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). Compounds 2,4-dinitrophenol (r=0.9956) and 4,6-dinitro-2-methylphenol (r=0.9972) were quantified using linear or second order regression with correlation coefficients >0.995, therefore, no qualifiers were applied based upon the high %RSDs. Samples AOSD01 (F51154-4), AOSD02 (F51154-5), 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) were analyzed using this initial calibration.

- Initial calibration for the SVOCs was performed on 07/31/07 on instrument MSBNA03. Target compounds 2,4-dinitrophenol (43.8%; grossly exceeding) and 4,6-dinitro-2-methylphenol (22.8%) were outside criteria. All other target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). Compounds 2,4-dinitrophenol (r=0.9962) and 4,6-dinitro-2-methylphenol (r=0.9982) were quantified using linear or second order regression with correlation coefficients >0.995, therefore, no qualifiers were applied based upon the high %RSDs. No samples reported were analyzed using this initial calibration.

- Initial calibration for the SVOCs was performed on 07/13/07 on instrument MSBNA04. Target compounds 2,4-dinitrophenol (42.0%; grossly exceeding) and 4,6-dinitro-2-methylphenol (24.0%) were outside criteria. All other target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). Compounds 2,4-dinitrophenol (r=0.9988) and 4,6-dinitro-2-methylphenol (r=0.9995) were quantified using linear or second order regression with correlation coefficients >0.995, therefore, no qualifiers were applied based upon the high %RSDs. Samples AOSW01 (F51154-1), AOSW02 (F51154-2), TMSW01 (F51154-3), 41SW08 (F51154-6), 41SW09 (F51154-7), and 41SW10 (F51154-8) as well as the confirmation for sample 49SS03 (F51154-24) were analyzed using this initial calibration.

- Initial calibration for the PAHs by SIM was performed on 07/27/07 on instrument MSBNA01, all target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). No qualifiers were applied. Samples AOSD01 (F51154-4), AOSD02 (F51154-5), LFSW01 (F51154-17), AOSW01 (F51154-1), AOSW02 (F51154-2), TMSW01 (F51154-3), 41SW08 (F51154-6), 41SW09 (F51154-7), 41SW10 (F51154-8), 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) were analyzed using this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used was capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Continuing calibration standards containing both target and surrogates compounds are analyzed at the beginning of each 12-hour analysis period following the analysis of the instrument performance check and prior to the analysis of blanks and samples. The minimum relative response factors (RRF) for semivolatile target compounds and surrogates must be ≥0.05. The DoD QSM specifies that the percent difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within ±20% for all target compounds. Grossly exceeding is defined where %D>40%. All detects are qualified as estimated "J" for where there were exceeding %Ds, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- For SVOC initial calibration verification performed on 07/05/07 @15:27 on instrument MSBNA02, 3-nitroaniline (26.0%) was outside criteria limits. For all other target compounds, all criteria were met. All samples were non-detect for 3-nitroaniline. No qualifiers were applied. No samples reported apply to this initial calibration verification.

- For SVOC initial calibration verification performed on 07/05/07 @15:55 on instrument MSBNA02, all criteria were met for all target compounds. No qualifiers were applied. No samples reported apply to this initial calibration verification.

- For SVOC continuing calibration performed on 07/31/07 @09:50 on instrument MSBNA02, all criteria were met for all target compounds. No qualifiers were applied. Sample LFSW01 (F51154-17) applies to this continuing calibration.

- For SVOC initial calibration verification performed on 07/23/07 @18:28 on instrument MSBNA03, 4-chloroaniline (44.6%; grossly exceeding) and 3-nitroaniline (27.8%) were outside criteria limits. For all other target compounds, all criteria were met. All samples were non-detect for 4-chloroaniline and 3-nitroaniline. No samples reported apply to this initial calibration verification. No qualifiers were applied.

- For SVOC initial calibration verification performed on 07/23/07 @18:58 on instrument MSBNA03, all criteria were met for all target compounds. No qualifiers were applied. No samples reported apply to this initial calibration verification.

- For SVOC continuing calibration performed on 07/26/07 @09:59 on instrument MSBNA03, all criteria were met for all target compounds. No qualifiers were applied. Samples AOSD01 (F51154-4) and AOSD02 (F51154-5) apply to this continuing calibration.

- For SVOC continuing calibration performed on 07/30/07 @09:46 on instrument MSBNA03, all criteria were met for all target compounds. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this continuing calibration.

- For SVOC initial calibration verification performed on 07/31/07 @16:11 on instrument MSBNA03, 4-chloroaniline (43.4%; grossly exceeding) and 3-nitroaniline (35.4%) were outside criteria limits. For all other target compounds, all criteria were met. All samples were non-detect for 4-chloroaniline and 3-nitroaniline. No samples reported apply to this initial calibration verification. No qualifiers were applied.

- For SVOC initial calibration verification performed on 07/31/07 @16:42 on instrument MSBNA03, all criteria were met for all target compounds. No qualifiers were applied. No samples reported apply to this initial calibration verification.

- For SVOC continuing calibration performed on 08/01/07 @12:32 on instrument MSBNA03, all criteria were met for all target compounds. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For SVOC initial calibration verification performed on 07/13/07 @13:48 on instrument MSBNA04, 4-chloroaniline (38.2%) and 3-nitroaniline (39.0%) were outside criteria limits. For all other target compounds, all criteria were met. All samples were non-detect for 4-chloroaniline and 3-nitroaniline. No samples reported apply to this initial calibration verification. No qualifiers were applied.

- For SVOC initial calibration verification performed on 07/13/07 @14:19 on instrument MSBNA04, all criteria were met for all target compounds. No qualifiers were applied. No samples reported apply to this initial calibration verification.

- For SVOC continuing calibration performed on 07/31/07 @11:19 on instrument MSBNA04, all criteria were met for all target compounds. No qualifiers were applied. Samples AOSW01 (F51154-1), AOSW02 (F51154-2), TMSW01 (F51154-3), 41SW08 (F51154-6), 41SW09 (F51154-7), and 41SW10 (F51154-8) apply to this continuing calibration.

- For SVOC continuing calibration performed on 08/06/07 @11:28 on instrument MSBNA04, all criteria were met for all target compounds. No qualifiers were applied. Confirmation for sample 49SS03 (F51154-24) applies to this continuing calibration.

- For PAH by SIM initial calibration verification performed on 07/27/07 @20:02 on instrument MSBNA01, all criteria were met for all target compounds. No qualifiers were applied. Samples AOSD01 (F51154-4) and AOSD02 (F51154-5) apply to this initial calibration verification.

- For PAH by SIM continuing calibration performed on 07/30/07 @11:52 on instrument MSBNA01, all criteria were met for all target compounds. No qualifiers were applied. Samples apply to this continuing calibration.

- For PAH by SIM continuing calibration performed on 07/30/07 @23:02 on instrument MSBNA01, all criteria were met for all target compounds. No qualifiers were applied. Sample LFSW01 (F51154-17) applies to this continuing calibration.

- For PAH by SIM continuing calibration performed on 07/30/07 @11:52 on instrument MSBNA01, all criteria were met for all target compounds. No qualifiers were applied. Samples AOSW01 (F51154-1), AOSW02 (F51154-2), TMSW01 (F51154-3), 41SW08 (F51154-6), 41SW09 (F51154-7), and 41SW10 (F51154-8) apply to this continuing calibration.

- For PAH by SIM continuing calibration performed on 07/31/07 @09:58 on instrument MSBNA01, all criteria were met for all target compounds. No qualifiers were applied. Samples 41SD08 (F51154-9) and 41SD09 (F51154-10) apply to this continuing calibration.

- For PAH by SIM continuing calibration performed on 08/01/07 @13:31 on instrument MSBNA01, all criteria were met for all target compounds. No qualifiers were applied. Samples 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this continuing calibration.

V-Blank Analysis

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. A method blank analysis must be performed after the calibration standards and once every 12-hour time period beginning with the injection of DFTPP. No contaminants should be detected in any of the associated blanks > the MDL. DoD QSM criteria specifies all concentrations should be less than one-half MRL (<MRL for common laboratory contaminants phthalate esters). Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants phthalate esters, or 5 times (5X) the maximum amount for other semivolatile target compounds. **Table 2** summarizes the blank contamination analysis. Action levels are based upon dilution factor of one and for solid matrices were converted to soil values (soil conversion factor = 33) if needed. Rinse blank RB083007 (F52208-1) (low-flow pump) applies to the groundwater "GW" samples in this SDG. The surface water "SW" samples were collected directly into the laboratory bottles; therefore, no rinse blank applies for the SW samples. Rinse blanks 072407R (F51275-1) and 072507R (F51300-31) apply to the surface soil "SS" and subsurface soil "SB" samples in this SDG. Rinse blank RB071807 (F51154-12) applies to the sediment "SD" samples in this SDG.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
07/31/07	OP21580-MB	All SVOC target <½MRL	NA	NA	None
08/01/07	OP21580-MB	All SVOC target <½MRL	NA	NA	None
07/31/07	OP21610-MB	All SVOC target <½MRL	NA	NA	None
07/30/07	OP21581-MB	All PAH SIM target <½MRL	NA	NA	None
07/30/07	OP21611-MB	All PAH SIM target <½MRL	NA	NA	None
07/05/07	OP21206-MB	All PAH SIM target <½MRL	NA	NA	None
09/15/07	RB083007	All SVOC target <½MRL	NA	NA	None
09/20/07	RB083007	All PAH SIM target <½MRL	NA	NA	None

Table 2 Blank Contamination Analysis Summary, Continued

Analysis Date	QC Blank ID	Compound	Max Conc. µg/kg	Action Level µg/kg	B qualified samples
07/26/07	OP21602-MB	All SVOC target <½MRL	NA	NA	None
07/30/07	OP21634-MB	All SVOC target <½MRL	NA	NA	None
07/27/07	OP21630-MB	All PAH SIM target <½MRL	NA	NA	None
07/31/07	OP21636-MB	All PAH SIM target <½MRL	NA	NA	None
08/01/07	OP21636-MB	All PAH SIM target <½MRL	NA	NA	None
07/31/07	RB071807	All SVOC target <½MRL	NA	NA	None
07/30/07	RB071807	All PAH SIM target <½MRL	NA	NA	None
08/02/07	072407R	All SVOC target <½MRL	NA	NA	None
08/02/07	072407R	All PAH SIM target <½MRL	NA	NA	None
08/02/07	072507R	All SVOC target <½MRL	NA	NA	None
08/02/07	072507R	All PAH SIM target <½MRL	NA	NA	None

NA = Not applicable.
MRL = Method reporting limit.

VI-Surrogate Spikes

Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Surrogate spikes are added to all samples and blanks to measure their recovery in sample and blank matrices. The percent recoveries (%Rs) must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-2 and Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Criteria:
2-Fluorophenol (14-62%) – (DoD QSM = 20-110%)
Phenol – d5 (10-40%) – (DoD QSM = 10-115%)
2,4,6-Tribromophenol (33-118%) – (DoD QSM = 40-125%)
Nitrobenzene-d5 (42-108%) – (DoD QSM = 40-110%)
2-Fluorobiphenyl (40-106%) – (DoD QSM = 50-110%)
p-Terphenyl – d14 (39-121%) – (DoD QSM = 50-135%)

Solid Criteria:
2-Fluorophenol (40-102%) – (DoD QSM = 35-105%)
Phenol – d5 (41-100%) – (DoD QSM = 40-100%)
2,4,6-Tribromophenol (42-108%) – (DoD QSM = 35-125%)
Nitrobenzene-d5 (40-105%) – (DoD QSM = 35-100%)
2-Fluorobiphenyl (43-107%) – (DoD QSM = 45-105%)
p-Terphenyl – d14 (45-119%) – (DoD QSM = 30-125%)

- For soil sample 49SS03 (F51154-24), 2,4,6-tribromophenol (41.0%) was outside lab criteria; however within DoD QSM criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier. The sample was rerun for confirmation with 59.0% recovery.

- For all other field samples, all surrogates were within criteria limits. No qualifiers were applied.

VII-Internal Standards

Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Internal standard area counts for samples and blanks must not vary by more than a factor of two (-50% to +100%) from the associated calibration standard. The retention time of the internal standards in samples and blanks must not vary by more than ±30 seconds from the retention time of the associated calibration standard.

- All criteria were met. No qualifiers were applied.

VIII-Laboratory Control Sample

Laboratory control samples (LCS) are used to monitor laboratory accuracy by calculating the percent recoveries of the spiked compounds. All LCS percent recoveries must be within the specified control limits. DoD LCS aqueous recovery limits are specified in Table D-2 and Table D-6 of the DoD QSM (DoD, 2006). DoD LCS solid recovery limits are specified in Table D-2 and Table D-7 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP21580-BS was used as the aqueous LCS for the SVOC analysis on 07/31/07. Benzoic acid (8%) was grossly below (i.e. <10%R) the laboratory and/or the DoD QSM criteria. Benzoic acid was qualified rejected "R" based upon the very low recovery. All other compounds were within criteria. Samples AOSW01 (F51154-1), AOSW02 (F51154-2), TMSW01 (F51154-3), 41SW08 (F51154-6), 41SW09 (F51154-7), and 41SW10 (F51154-8) apply to this LCS.

- Sample OP21610-BS was used as the aqueous LCS for the SVOC analysis on 07/31/07. All criteria were met. No qualifiers were applied. Sample LFSW01 (F51154-17) applies to this LCS.

- Sample OP21602-BS was used as the solid LCS for the SVOC analysis on 07/26/07. All criteria were met. No qualifiers were applied. Samples AOSD01 (F51154-4) and AOSD02 (F51154-5) apply to this LCS.

- Sample OP21634-BS was used as the solid LCS for the SVOC analysis on 07/30/07. All criteria were met. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this LCS.

- Sample OP21581-BS was used as the aqueous LCS for the PAH SIM analysis on 07/30/07. All criteria were met. No qualifiers were applied. Samples AOSW01 (F51154-1), AOSW02 (F51154-2), TMSW01 (F51154-3), 41SW08 (F51154-6), 41SW09 (F51154-7), and 41SW10 (F51154-8) apply to this LCS.

- Sample OP21611-BS was used as the aqueous LCS for the PAH SIM analysis on 07/30/07. 1-Methylnaphthalene (57%) and 2-methylnaphthalene (55%) were below laboratory criteria. The associated sample was non-detect for these compounds and was qualified bias low "UL" based upon the low recoveries. Sample LFSW01 (F51154-17) applies to this LCS.

- Sample OP21630-BS was used as the solid LCS for the PAH SIM analysis on 07/27/07. All criteria were met. No qualifiers were applied. Samples AOSD01 (F51154-4) and AOSD02 (F51154-5) apply to this LCS.

- Sample OP21636-BS was used as the solid LCS for the PAH SIM analysis on 07/31/07. All criteria were met. No qualifiers were applied. No samples reported were analyzed using this LCS.

- Sample OP21636-BS was used as the solid LCS for the PAH SIM analysis on 08/01/07. All criteria were met. No qualifiers were applied. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this LCS.

IX-Matrix Spike/Matrix Spike Duplicate

Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD aqueous MS/MSD recovery limits follow the LCS criteria and are specified in Table D-2 and Table D-6 of the DoD QSM (DoD, 2006). DoD solid MS/MSD recovery limits follow the LCS criteria and are specified in Table D-2 and Table D-7 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample AOSW02 (F51154-2) was used for the aqueous MS/MSD for SVOC analysis on 07/31/07. All criteria were met. No qualifiers were applied. Samples AOSW01 (F51154-1), AOSW02 (F51154-2), TMSW01 (F51154-3), 41SW08 (F51154-6), 41SW09 (F51154-7), and 41SW10 (F51154-8) apply to this MS/MSD.

- Sample LFSW01 (F51154-17) was used for the aqueous MS/MSD for SVOC analysis on 07/31/07. 4-Nitrophenol (56%) and phenol (56%, 56%) were above laboratory accuracy criteria; however, within DoD QSM criteria. All other target compounds were within criteria. The associated aqueous LCS was within criteria and all surface water samples were non-detect for these compounds. No qualifiers were applied for 4-nitrophenol and phenol based upon these outliers. Sample LFSW01 (F51154-17) applies to this MS/MSD.

- Sample F51123-5 was used for the MS/MSD for the solid SVOC analysis on 07/26/07. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Samples AOSD01 (F51154-4) and AOSD02 (F51154-5) apply to this MS/MSD.

- Sample APSD01 (F51154-18) was used for the solid MS/MSD for SVOC analysis on 07/30/07. Benzoic acid (RPD=37%), 1,3-dichlorobenzene (43%), 1,4-dichlorobenzene (44%), 3,3'-dichlorobenzidine (25%, 24%), hexachlorocyclopentadiene (13%, 10%), and hexachloroethane (41%, 33%) were below laboratory and/or DoD QSM accuracy criteria. All other target compounds were within criteria. The associated solid LCS was within criteria and all solid samples were non-detect for these compounds. 1,3-Dichlorobenzene, 1,4-dichlorobenzene, 3,3'-dichlorobenzidine, hexachlorocyclopentadiene, and hexachloroethane were non-detect for the spiked sample and qualified "UL" based upon the low recoveries. No qualifiers were applied for benzoic acid based upon this outlier. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this MS/MSD.

- Sample AOSW02 (F51154-2) was used for the aqueous MS/MSD for PAH SIM analysis on 07/03/07. All criteria were met. No qualifiers were applied. Samples AOSW01 (F51154-1), AOSW02 (F51154-2), TMSW01 (F51154-3), 41SW08 (F51154-6), 41SW09 (F51154-7), and 41SW10 (F51154-8) apply to this MS/MSD.

- Sample LFSW01 (F51154-17) was used for the aqueous MS/MSD for PAH SIM analysis on 07/03/07. All criteria were met. No qualifiers were applied. Sample LFSW01 (F51154-17) applies to this MS/MSD.

- Sample F51296-22 was used for the MS/MSD for the solid PAH SIM analysis on 07/28/07. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Samples AOSD01 (F51154-4) and AOSD02 (F51154-5) apply to this MS/MSD.

- Sample 41SD09 (F51154-10) was used for the solid MS/MSD for PAH SIM analysis on 07/31/07. Benzo(g,h,i)perylene (53%), indeno(1,2,3-cd)pyrene (56%), benzo(b)fluoranthene (67%, 65%), benzo(k)fluoranthene (60%), chrysene (57%), benzo(a)pyrene (68%), and benzo(a)anthracene (61%) were below laboratory; however, within DoD QSM accuracy criteria. All other target compounds were within criteria. The associated solid LCS was within criteria. Benzo(g,h,i)perylene, indeno(1,2,3-cd)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, benzo(a)pyrene, and benzo(a)anthracene were detected for the spiked sample and qualified "L" based upon the low recoveries. Samples 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), TMSD01 (F51154-16), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), 49SS05 (F51154-26), 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) apply to this MS/MSD.

X-Field Duplicate Sample Analysis

Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field surface water sample duplicate pair AOSW01 (F51154-1) and TMSW01 (F51154-3) was collected for TCL SVOCs and PAHs. All detected TCL SVOCs and PAHs found in the sample and its duplicate pair and associated %RPD are noted in **Table 3**. All other TCL SVOC and PAH target compounds were non-detect. Phenanthrene (58.5%) was above criteria due to low concentration levels detected below the MRL. Phenanthrene was qualified estimated "J" for the original and duplicate pair samples based upon this outlier. For all other compounds, all criteria were met.

Table 3 Field Precision Hits Analysis Summary for TCL SVOCs and PAHs for Duplicate Pair AOSW01 (F51154-1) and TMSW01 (F51154-3)

Compound	Original Sample (µg/L)	Duplicate Pair (µg/L)	%RPD
Acenaphthene	0.91J	0.75J	19.3
Phenanthrene	0.95J	0.52J	58.5
Fluorene	1.7	1.3	26.7
1-Methylnaphthalene	4.8	3.4	34.2

J = Estimated value <MRL and >MDL.

- Field surface soil sample duplicate pair 49SS05 (F51154-26) and TMSS05 (F51154-32) was collected for TCL SVOCs and PAHs. All TCL SVOC and PAH target compounds were non-detect. All criteria were met. No qualifiers were applied.

- Field sediment sample duplicate pair LFSD01 (F51154-15) and TMSD01 (F51154-16) was collected for TCL SVOCs and PAHs. All detected TCL SVOCs and PAHs found in the sample and its duplicate pair and associated %RPD are noted in **Table 4**. All other TCL SVOC and PAH target compounds were non-detect. All criteria were met. No qualifiers were applied.

Table 4 Field Precision Hits Analysis Summary for TCL SVOCs and PAHs for Duplicate Pair LFSD01 (F51154-15) and TMSD01 (F51154-16)

Compound	Original Sample (µg/kg)	Duplicate Pair (µg/kg)	%RPD
Benzo(g,h,i)perylene	92U	20.8J	NA
Indeno(1,2,3-cd)pyrene	92U	20.2J	NA
Benzo(b)fluoranthene	45.6J	37.5J	19.5
Benzo(k)fluoranthene	31.2J	26.9J	14.8
Chrysene	43.0J	32.8J	26.9
Benzo(a)pyrene	31.9J	27.9J	13.4
Benzo(a)anthracene	29.0J	26.2J	10.1

J = Estimated value <MRL and >MDL.
U = Non-detect as <MRL.
NA = Not Applicable

XI-Quantitation Verification

The accuracy of analytical results was verified through the calculation of several parameters. Percent difference (%D) between the calculated and reported values must be ≤10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J."

Sample: AOSW02MS (F51154-2MS), bis(2-ethylhexyl)phthalate

Conc. (µg/L) = {(Ax)*(Is)*(Vt)*(DF)}/{(Ais)*(RRF)*(V_o)*(V_i)}

where:

	$Conc_{sample}$	=	Sample concentration in µg/L
	A_x	=	Area of characteristic ion for compound being measured.
	I_s	=	Amount of internal standard injected (ng).
	V_t	=	Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10,000 µL.
	A_{is}	=	Area of characteristic ion for the internal standard.
	RRF_A	=	Average relative response factor for compound being measured
	V_o	=	Volume of water extracted (mL).
	V_i	=	Volume of extract injected (µL).
	DF	=	Dilution Factor

Conc. µg/L = (381474 * 40 * 1000 * 1) / (413841 * 0.892 * 480 * 1) = 86.1 ng/mL
= 86.1 µg/L

Reported Value = 86.2 µg/L
% Difference = 0.1%
Values were within 10% difference.

Sample: AOSW01 (F51154-1), fluorene

Conc. (µg/L) = {(Ax)*(Is)*(Vt)*(DF)}/{(Ais)*(RRF)*(V_o)*(V_i)}

where:	$Conc_{sample}$	=	Sample concentration in µg/L
	A_x	=	Area of characteristic ion for compound being measured.
	I_s	=	Amount of internal standard injected (ng).
	V_t	=	Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10,000 µL.
	A_{is}	=	Area of characteristic ion for the internal standard.
	RRF_A	=	Average relative response factor for compound being measured
	V_o	=	Volume of water extracted (mL).
	V_i	=	Volume of extract injected (µL).
	DF	=	Dilution Factor

Conc. µg/L = (71366 * 4 * 1000 * 1) / (128124 * 1.333 * 980 * 1) = 1.7 ng/mL
= 1.7 µg/L

Reported Value = 1.7 µg/L
% Difference = 0.0%
Values were within 10% difference.

Sample: 49SS02 (F51154-23), di-n-butyl phthalate

Conc. µg/kg = (Ax * Is * Vt * DF) / (Ais * RRF * Vi * Ws * D)

where:	Conc.	= Sample concentration in µg/kg
	Ax	= Area of characteristic ion for compound being measured.
	Is	= Amount of internal standard injected (ng).
	Vt	= Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10,000 uL.
	Ais	= Area of characteristic ion for the internal standard.
	RRF	= Average relative response factor for compound being measured (from ICAL)
	Vi	= Volume of extract injected (uL).
	W(s)	= Weight of sample extracted or diluted in grams.
	D	= Percent dry weight (100 - % moisture in sample)/100
	DF	= Dilution factor

Conc. µg/kg = (47730 * 40 * 1000 * 1) / (452232 * 1.278 * 1 * 30.0 * 0.8960) = 123 µg/kg
Reported Value = 123 µg/kg
% Difference = 0.0%
Values were within 10% difference

Sample: 49SS02 (F51154-23), chrysene

Conc. µg/kg = (Ax * Is * Vt * DF) / (Ais * RRF * Vi * Ws * D)

where: Conc. = Sample concentration in µg/kg
Ax = Area of characteristic ion for compound being measured.
Is = Amount of internal standard injected (ng).
Vt = Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10,000 uL.
Ais = Area of characteristic ion for the internal standard.
RRF = Average relative response factor for compound being measured (from ICAL)
Vi = Volume of extract injected (uL).
W(s) = Weight of sample extracted or diluted in grams.
D = Percent dry weight (100 - % moisture in sample)/100
DF = Dilution factor

Conc. µg/kg = (3895 * 4.0 * 1000 * 4) / (81063 * 1.670 * 1 * 30.0 * 0.8960) = 17.1 µg/kg
Reported Value = 17.1 µg/kg
% Difference = 0.0%
Values were within 10% difference

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Eric Malarek, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation - Volatiles
Accutest Laboratories, Inc., SDG F51154

DATE: September 25, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at Main Manufacturing Area at RFAAP for a RFI/CMS Nine Sites on July 18, 2007 and July 19, 2007. The samples were analyzed for target compound list (TCL) volatile organic compounds (VOCs) using USEPA SW846 Method 5030B/8260B for aqueous matrices and USEPA SW846 Method 5035/8260B for solid matrices. A total of seven aqueous samples and eighteen solid samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
AOSW01	F51154-1	APSD01	F51154-18
AOSW02	F51154-2	41SD11	F51154-22
TMSW01	F51154-3	49SS02	F51154-23
AOSD01	F51154-4	49SS03	F51154-24
AOSD02	F51154-5	49SS04	F51154-25

41SD08	F51154-9	59SS08	F51154-29
41SD09	F51154-10	59SS09	F51154-30
41SD10	F51154-11	59SS10	F51154-31
LFSD01	F51154-15	TMSS05	F51154-32
LFSW01	F51154-17		

Data were reviewed by Eric Malarek and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Instrument Performance Results
	X	Initial Calibration
X		Continuing Calibration
	X	Blank Analysis
X		Laboratory Control Sample
X		Matrix Spike / Spike Duplicate Sample
	X	System Monitoring Compounds

RFAAP VALIDATION REPORT
VOLATILES REVIEW
SDG F51154

I-Holding Times and Preservation
The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of analysis. Holding time criteria: For aqueous samples cooled @ 4°C±2°C; pH<2 HCl, the maximum holding time is 14 days (7 days if no HCl added) from sample collection to analysis. For soil samples cooled @ 4°C±2°C; the maximum holding time is 14 days from sample collection to analysis.

- Temperature Review: The temperature blank was sent with each cooler and recorded by the laboratory upon receipt. For samples collected on 07/18/07 and 07/19/07, the coolers were received by the primary laboratory (Accutest) on 07/20/07 at 4.0°C, 4.0°C, 4.6°C, 4.6°C, 4.8°C, 5.0°C, 5.0°C, and 5.8°C. The herbicides were subcontracted to Accutest TX and were received the samples at 4.2°C, 4.0°C, and 3.6°C. The perchlorate subcontract laboratory (Datachem Laboratories, Inc.) received the aqueous samples at 3.0°C. The dioxin subcontract laboratory (SGS Paradigm Analytical Laboratories, Inc.) received the samples at 5.5°C and 5.2°C. All criteria were met. No qualifiers were applied.

- Holding Time Review: The aqueous samples were collected for TCL VOCs on 07/18/07 and 07/19/07. For the aqueous samples collected 07/18/07, the VOCs were prepped and analyzed on 07/26/07 and 07/31/07 (LFSW01). For the solid samples collected 07/18/07 and 07/19/07, the VOCs were prepped and analyzed on 07/26/07, 07/27/07, and 07/28/07. All criteria were met. No qualifiers were applied.

II-Instrument Performance Check
The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed.

- The instrument performance check, bromofluorobenzene (BFB), met the ion abundance criteria. No qualification was applied.

III-Initial Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The RRF must be greater than 0.1 for chloromethane, 1,1-dichloroethane, and bromoform and greater than 0.3 for 1,1,2,2-tetrachloroethane and chlorobenzene. The minimum relative response factor (RRF) must be ≥0.05 for all other compounds. The DoD QSM specifies that the percent relative standard deviation (%RSD) must be ≤15% for each target compound and must be ≤30% for each calibration check compound. For compounds analyzed using linear regression or second order, correlation coefficients must be >0.995 and coefficients of determination >0.99. All detects are qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- For initial calibration performed on 07/25/07 on instrument MSVOA9, target compounds methylene chloride (49.2%; grossly exceeding) and acetone (21.3%) were outside criteria. All other target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). Compounds methylene chloride (r=0.9984) and acetone (r=0.9995) were quantified using linear or second order regression with correlation coefficients >0.995; therefore, no qualifiers were applied based upon these outliers. Samples 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), 59SS10 (F51154-31), and TMSS05 (F51154-32) were analyzed using this initial calibration.

- For initial calibration performed on 07/16/07 on instrument MSVOA3, target compounds acetone (18.5%), methylene chloride (32.0%; grossly exceeding), ethylbenzene (15.1%), m,p-xylene (16.6%), and o-xylene (15.4%) were outside criteria. All other target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). Compounds acetone (r=0.9962), methylene chloride (r=1.0000), ethylbenzene (r=0.9985), m,p-xylene (r=0.9988), and o-xylene (r=0.9990) were quantified using linear or second order regression with correlation coefficients >0.995; therefore, no qualifiers were applied based upon these outliers. Samples AOSD01 (F51154-4), AOSD02 (F51154-5), 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), and 49SS05 (F51154-26) as well as the sample confirmations for samples 41SD08 (F51154-9), 41SD10 (F51154-11), 49SS02 (F51154-23), 49SS03 (F51154-24), and 49SS05 (F51154-26) were analyzed using this initial calibration.

- For initial calibration performed on 07/18/07 on instrument MSVOA6, target compounds bromomethane (24.2%), chloroethane (30.7%; grossly exceeding), carbon disulfide (17.4%), methylene chloride (39.6%; grossly exceeding), acetone (22.6%), trans-1,2-dichloroethene (18.2%), and benzene (16.8%) were outside %RSD/RRF criteria. All RSDs/RRFs (RRF≥0.05) were within criteria for all other target compounds. Compounds bromomethane (r=0.9982), chloroethane (r=0.9974), carbon disulfide (r=0.9994), methylene chloride (r=0.9995), acetone (r=0.9989), trans-1,2-dichloroethene (r=1.0000), and benzene (r=1.0000) were quantified using linear or higher order with correlations >0.995; therefore, no qualifiers were applied based upon these outliers. Samples AOSW01 (F51154-1), AOSW02 (F51154-2), TMSW01 (F51154-3), 41SW08 (F51154-6), 41SW09 (F51154-7), and 41SW10 (F51154-8) were analyzed using this initial calibration.

- For initial calibration performed on 07/31/07 on instrument MSVOA6, target compounds bromomethane (22.0%), chloroethane (21.9%), methylene chloride (123%; grossly exceeding), and trans-1,3-dichloropropene (21.2%) were outside %RSD/RRF criteria. All RSDs/RRFs (RRF≥0.05) were within criteria for all other target compounds. Compounds bromomethane (r=0.9954), chloroethane (r=0.9957), methylene chloride (r=0.9962), and trans-1,3-dichloropropene (r=0.9998) were quantified using linear or higher order with correlations >0.995; therefore, no qualifiers were applied based upon these outliers. Sample LFSW01 (F51154-17) was analyzed using this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Continuing calibration establishes the 12-hour relative response factors on which the quantitations are based and checks satisfactory performance of the instrument on a day-to-day basis. The RRF must be greater than 0.1 for chloromethane, 1,1-dichloroethane, and bromoform and greater than 0.3 for 1,1,2,2-tetrachloroethane and chlorobenzene. The minimum relative response factor (RRF) must be ≥0.05 for all other compounds. The DoD QSM specifies that the percent difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within 20% for all target compounds. All detects are qualified as estimated "J" for where there were exceeding %Ds, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- For initial calibration verification performed on 07/25/07 @15:34 on instrument MSVOA9, bromomethane (28.8%) was outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). Bromomethane was non-detect for all samples; therefore, no qualifiers were applied based upon the high %D. No samples reported apply to this initial calibration verification. No qualifiers were applied based upon this outlier.

- For continuing calibration performed on 07/27/07 @11:30 on instrument MSVOA9, target compounds bromomethane (20.8%) and acetone (59.9%; grossly exceeding) were outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). Acetone was qualified estimated "J" for detects and "UJ" for non-detects based upon the very high %Drift. Bromomethane was non-detect for all associated samples; therefore no qualifiers were applied based upon this outlier. Samples 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), and 59SS10 (F51154-31) apply to this continuing calibration.

- For continuing calibration performed on 07/28/07 @12:33 on instrument MSVOA9, all criteria were met. No qualifiers were applied. Sample TMSS05 (F51154-32) applies to this continuing calibration.

- For initial calibration verification performed on 07/16/07 @18:20 on instrument MSVOA3, bromomethane (36.1%) was outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). Bromomethane was non-detect for all samples; therefore, no qualifiers were applied based upon the high %D. No samples reported apply to this initial calibration verification. No qualifiers were applied based upon this outlier.

- For continuing calibration performed on 07/26/07 @10:18 on instrument MSVOA3, target compounds acetone (77.6%; grossly exceeding) and 2-butanone (23.6%) were outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). Acetone was qualified estimated "J" for detects and "UJ" for non-detects based upon the very high %Drift. 2-Butanone (MEK) was qualified estimated "J" for detects and no qualifier for non-detects based upon the high %Drift. Samples AOSD01 (F51154-4), AOSD02 (F51154-5), 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), and 49SS05 (F51154-26) apply to this continuing calibration.

- For continuing calibration performed on 07/27/07 @11:02 on instrument MSVOA3, target compounds acetone (55.4%; grossly exceeding), 1,1,1-trichloroethane (25.9%) and carbon tetrachloride (30.4%) were outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). Acetone was qualified estimated "J" for detects and "UJ" for non-detects based upon the very high %Drift. 1,1,1-Trichloroethane and carbon tetrachloride were non-detect for all associated confirmation samples; therefore, no qualifiers were applied based upon these outliers. Sample confirmations 41SD08 (F51154-9), 41SD10 (F51154-11), 49SS02 (F51154-23), 49SS03 (F51154-24), and 49SS05 (F51154-26) apply to this continuing calibration.

- For initial calibration verification performed on 07/18/07 @12:59 on instrument MSVOA6, target compound bromomethane (31.1%) was outside criteria. All criteria (%D≤20%; %Drift≤20%; RRF≥0.05) were met for all other target compounds. No samples reported apply to this initial calibration verification. No qualifiers were applied based upon this outlier.

- For continuing calibration performed on 07/26/07 @10:10 on instrument MSVOA6, target compound chloroethane (27.8%) was outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). Chloroethane was non-detect for all associated samples; therefore no qualifiers were applied based upon the high %D. Samples AOSW01 (F51154-1), AOSW02 (F51154-2), TMSW01 (F51154-3), 41SW08 (F51154-6), 41SW09 (F51154-7), and 41SW10 (F51154-8) apply to this continuing calibration.

- For initial calibration verification performed on 07/31/07 @13:39 on instrument MSVOA6, target compound bromomethane (21.8%), acetone (22.5%), and trans-1,3-dichloropropene (20.5%) were outside criteria. All criteria (%D≤20%; %Drift≤20%; RRF≥0.05) were met for all other target compounds. No samples reported apply to this initial calibration verification. No qualifiers were applied based upon these outliers.

- For continuing calibration performed on 07/31/07 @14:27 on instrument MSVOA6, all target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). No qualifiers were applied. Sample LFSW01 (F51154-17) applies to this continuing calibration.

V-Blank Analysis

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. A method blank analysis must be performed after the calibration standards and once every 12-hour time period beginning with the injection of BFB. No contaminants should be detected in any of the associated blanks > the MDL. The DoD QSM criteria specifies all concentrations should be less than one-half MRL (<MRL for common laboratory contaminants methylene chloride, acetone, and 2-butanone). Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants methylene chloride, acetone, and 2-butanone (MEK), or 5 times (5X) the maximum amount for other volatile target compounds. **Table 2** summarizes the blank contamination analysis. Action levels are based upon dilution factor of one and for solid matrices were converted to soil values (soil conversion factor = 1) as needed. Rinse blank RB083007 (F52208-1) (low-flow pump) applies to the groundwater "GW" samples in this SDG. The surface water "SW" samples were collected directly into the laboratory bottles; therefore, no rinse blank applies for the SW samples. Rinse blanks 072407R (F51275-1) and 072507R (F51300-31) apply to the surface soil "SS" and subsurface soil "SB" samples in this SDG. Rinse blank RB071807 (F51154-12) applies to the sediment "SD" samples in this SDG. The trip blanks 071807TW (F51154-13) and TB071907W (F51154-21) apply to the aqueous samples collected 07/18/07 and 07/19/07, respectively. The trip blanks 071807TS (F51154-14) and TB071907S (F51154-19) apply to the solid samples collected 07/18/07 and 07/19/07, respectively.

VI-Laboratory Control Sample

Data for laboratory control samples (LCS) are evaluated to determine long-term accuracy of the analytical method on various matrices. Percent recoveries (%Rs) should be within the specified control limits. The DoD aqueous LCS recovery limits are specified in Table D-4 of the DoD QSM (DoD, 2006). DoD LCS soil recovery limits are specified in Table D-5 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample VJ2187-BS was used as the aqueous LCS for the VOC analysis on 07/26/07. Trans-1,3-dichloropropene (83%) was below lab limits and within DoD QSM criteria. Trans-1,3-dichloropropene was non-detect for all associated samples; therefore, the samples were qualified bias low "UL" for these compounds based upon this outlier. All other percent recoveries were within criteria for all target compounds. Samples AOSW01 (F51154-1), AOSW02 (F51154-2), TMSW01 (F51154-3), 41SW08 (F51154-6), 41SW09 (F51154-7), and 41SW10 (F51154-8) apply to this LCS.

- Sample VJ2191-BS was used as the aqueous LCS for the VOC analysis on 07/31/07. All criteria were met. No qualifiers were applied. Sample LFSW01 (F51154-17) applies to this LCS.

- Sample VH1662-BS was used as the solid LCS for the VOC analysis on 07/26/07. Chloromethane (56%) was below the lab limits and within DoD QSM criteria and vinyl chloride (58%) was below both the DoD QSM and lab limits. Chloromethane and vinyl chloride were non-detect for all associated samples; therefore, the samples were qualified bias low "UL" for these compounds based upon these outliers. All other percent recoveries were within criteria for all target compounds. Samples AOSD01 (F51154-4), AOSD02 (F51154-5), 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), and 49SS05 (F51154-26) apply to this LCS.

- Sample VF413-BS was used as the solid LCS for the VOC analysis on 07/27/07. All criteria were met. No qualifiers were applied. Samples 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), and 59SS10 (F51154-31) apply to this LCS.

- Sample VF414-BS was used as the solid LCS for the VOC analysis on 07/28/07. All criteria were met. No qualifiers were applied. Sample TMSS05 (F51154-32) applies to this LCS.

VII-Matrix Spike/Matrix Spike Duplicate

Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. The DoD MS/MSD aqueous recovery limits follow the LCS criteria and are specified in Table D-4 of the DoD QSM (DoD, 2006). The DoD MS/MSD solid recovery limits follow the LCS criteria and are specified in Table D-5 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample AOSW02 (F51154-2) was used for the aqueous MS/MSD analysis on 07/26/07. Cis-1,3-dichloropropene (81%) and trans-1,3-dichloropropene (80%, 82%) were outside lab criteria and within DoD QSM criteria for the MS/MSD sample. The associated LCS was within criteria for these compounds (See Section VI). The associated samples were non-detect for these compounds; therefore, the spiked sample was qualified bias low "UL" for these compounds based upon these outliers. All other percent recoveries were within criteria for all target compounds. Samples AOSW01 (F51154-1), AOSW02 (F51154-2), TMSW01 (F51154-3), 41SW08 (F51154-6), 41SW09 (F51154-7), and 41SW10 (F51154-8) apply to this MS/MSD.

- Sample LFSW01 (F51154-17) was used for the aqueous MS/MSD analysis on 07/31/07. Bromomethane (146%, 148%) was outside DoD QSM criteria and within lab criteria for the MS/MSD sample. The associated LCS was within criteria for these compounds (See Section VI). The associated sample was non-detect for this compound; therefore, no qualifiers were applied based upon this outlier. All other percent recoveries were within criteria for all target compounds. Sample LFSW01 (F51154-17) applies to this MS/MSD.

- Sample AOSD02 (F51154-5) was used for the solid MS/MSD analysis on 07/26/07. Acetone (51%, 48%), bromoform (52%, 47%), chloroethane (56%, 60%), carbon tetrachloride (71%, 56%), dibromochloromethane (70%, 66%), trans-1,3-dichloropropene (82%), 2-hexanone (58%), 4-methyl-2-pentanone (65%), methyl bromide (52%, 56%), methyl chloride (39%, 46%), methylene chloride (202%, 171%), methyl ethyl ketone (48%, 55%), toluene (125%), and vinyl chloride (43%, 46%) were outside lab criteria and/or DoD QSM criteria for the MS/MSD sample. The associated LCS was within criteria for these compounds (See Section VI) except for methyl chloride and vinyl chloride. The associated samples were non-detect for all of these compounds. All associated samples were qualified bias low "UL" for methyl chloride and vinyl chloride based upon these outliers. The spiked sample was qualified bias low "L" for detects and "UL" for non-detects for acetone, bromoform, chloroethane, carbon tetrachloride, dibromochloromethane, trans-1,3-dichloropropene, 2-hexanone, 4-methyl-2-pentanone, methyl bromide, and methyl ethyl ketone based upon these outliers. No qualifiers were applied for methylene chloride and toluene based upon the high recoveries (spiked sample was non-detect for these compounds). All other percent recoveries were within criteria for all target compounds. Samples AOSD01 (F51154-4), AOSD02 (F51154-5), 41SD08 (F51154-9), 41SD09 (F51154-10), 41SD10 (F51154-11), LFSD01 (F51154-15), APSD01 (F51154-18), 41SD11 (F51154-22), 49SS02 (F51154-23), 49SS03 (F51154-24), 49SS04 (F51154-25), and 49SS05 (F51154-26) apply to this MS/MSD.

- Sample F51158-1 was used for the solid MS/MSD analysis for analysis on 07/27/07. Since this sample is not a RFAAP site sample, it was not evaluated. No qualifiers were applied. Samples 59SS06 (F51154-27), 59SS07 (F51154-28), 59SS08 (F51154-29), 59SS09 (F51154-30), and 59SS10 (F51154-31) apply to this MS/MSD.

- Sample F51333-1 was used for the solid MS/MSD analysis for analysis on 07/28/07. Since this sample is not a RFAAP site sample, it was not evaluated. No qualifiers were applied. Sample TMSS05 (F51154-32) applies to this MS/MSD.

VIII-System Monitoring Compounds (Surrogates)
Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Recoveries for system monitoring compounds in volatile samples and blanks must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Criteria:	Dibromofluoromethane (87-116%) (DoD QSM = 85-115%) 1,2-Dichloroethane-d4 (76-127%) (DoD QSM = 70-120%) Toluene-d8 (86-112%) (DoD QSM = 85-120%) 4-Bromofluorobenzene (84-120%) (DoD QSM = 75-120%)
Solid Criteria:	Dibromofluoromethane (80-121%) (DoD QSM = None Listed) 1,2-Dichloroethane-d4 (77-123%) (DoD QSM = None Listed) Toluene-d8 (71-130%) (DoD QSM = 85-115%) 4-Bromofluorobenzene (59-148%) (DoD QSM = 85-120%)

- For sample AOSD02 (F51154-5), 4-bromofluorobenzene (125%) was outside DoD QSM criteria and within lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier.

- For sample AOSD02 (F51154-5), 4-bromofluorobenzene (125%) was outside DoD QSM criteria and within lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier.

- For sample 41SD08 (F51154-9), 4-bromofluorobenzene (134%) was outside DoD QSM criteria and within lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier. The sample was rerun for confirmation with 129% recovery.

- For sample 41SD09 (F51154-10), 4-bromofluorobenzene (131%) was outside DoD QSM criteria and within lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier.

- For sample 41SD10 (F51154-11), 4-bromofluorobenzene (145%) was outside DoD QSM criteria and within lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier. The sample was rerun for confirmation with 134% recovery.

- For sample LFSD01 (F51154-15), 4-bromofluorobenzene (126%) was outside DoD QSM criteria and within lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier.

- For sample 41SD11 (F51154-22), 4-bromofluorobenzene (135%) was outside DoD QSM criteria and within lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier.

- For sample 49SS02 (F51154-23), 4-bromofluorobenzene (146%) was outside DoD QSM criteria and within lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier. The sample was rerun for confirmation with 134% recovery.

- For sample 49SS03 (F51154-24), 4-bromofluorobenzene (162%) was outside DoD QSM criteria and outside lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier. The sample was rerun for confirmation with 133% recovery.

- For sample 49SS04 (F51154-25), 4-bromofluorobenzene (125%) was outside DoD QSM criteria and within lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier.

- For sample 49SS05 (F51154-26), 4-bromofluorobenzene (130%) was outside DoD QSM criteria and within lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier. The sample was rerun for confirmation with 138% recovery.

- For sample 59SS09 (F51154-30), 4-bromofluorobenzene (132%) was outside DoD QSM criteria and within lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier.

- For sample TMSS05 (F51154-32), 4-bromofluorobenzene (121%) was outside DoD QSM criteria and within lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier.

- For all other samples, all criteria were met. No qualifiers were applied.

IX-Internal Standards (IS)
Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Specific criteria include: area counts (-50% to +100%) of the associated calibration standard, and retention time (± 30 seconds) from that of the associated calibration standard.

- For sample AOSD01 (F51154-4), internal standard 4 tert-butyl-alcohol-d10 was below criteria limits. No target analytes were quantified using this internal standard; therefore, no qualifiers were applied based upon this outlier. All other internal standards were within criteria.

- For sample AOSD02 (F51154-5), internal standard 4 tert-butyl-alcohol-d10 was below criteria limits. No target analytes were quantified using this internal standard; therefore, no qualifiers were applied based upon this outlier. All other internal standards were within criteria.

- For sample 41SD08 (F51154-9), internal standard 3 1,4-dichlorobenzene-d4 and internal standard 4 tert-butyl-alcohol-d10 were below criteria limits. No target analytes were quantified using 1,4-dichlorobenzene-d4 or tert-butyl-alcohol-d10; therefore, no qualifiers were applied based upon this outlier. All other internal standards were within criteria. The sample was rerun for confirmation.

- For sample 41SD10 (F51154-11), internal standard 3 1,4-dichlorobenzene-d4 and internal standard 4 tert-butyl-alcohol-d10 were below criteria limits. No target analytes were quantified using 1,4-dichlorobenzene-d4 or tert-butyl-alcohol-d10; therefore, no qualifiers were applied based upon this outlier. All other internal standards were within criteria. The sample was rerun for confirmation.

- For sample LFSD01 (F51154-15), internal standard 4 tert-butyl-alcohol-d10 was below criteria limits. No target analytes were quantified using this internal standard; therefore, no qualifiers were applied based upon this outlier. All other internal standards were within criteria.

- For sample 41SD11 (F51154-22), internal standard 4 tert-butyl-alcohol-d10 was below criteria limits. No target analytes were quantified using this internal standard; therefore, no qualifiers were applied based upon this outlier. All other internal standards were within criteria.

- For sample 49SS02 (F51154-23), internal standard 3 1,4-dichlorobenzene-d4 and internal standard 4 tert-butyl-alcohol-d10 were below criteria limits. No target analytes were quantified using 1,4-dichlorobenzene-d4 or tert-butyl-alcohol-d10; therefore, no qualifiers were applied based upon this outlier. All other internal standards were within criteria. The sample was rerun for confirmation.

- For sample 49SS03 (F51154-24), internal standard 3 1,4-dichlorobenzene-d4 and internal standard 4 tert-butyl-alcohol-d10 were below criteria limits. No target analytes were quantified using 1,4-dichlorobenzene-d4 or tert-butyl-alcohol-d10; therefore, no qualifiers were applied based upon this outlier. All other internal standards were within criteria. The sample was rerun for confirmation.

- For sample 49SS05 (F51154-26), internal standard 3 1,4-dichlorobenzene-d4 and internal standard 4 tert-butyl-alcohol-d10 were below criteria limits. No target analytes were quantified using 1,4-dichlorobenzene-d4 or tert-butyl-alcohol-d10; therefore, no qualifiers were applied based upon this outlier. All other internal standards were within criteria. The sample was rerun for confirmation.

- For all other samples, all criteria were met. No qualifiers were applied.

X-Field Duplicate Sample Analysis

Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field surface water sample duplicate pair AOSW01 (F51154-1) and TMSW01 (F51154-3) was collected for TCL VOCs. All TCL VOCs target compounds were non-detect. All criteria were met. No qualifiers were applied.

- Field surface soil sample duplicate pair 49SS05 (F51154-26) and TMSS05 (F51154-32) was collected for TCL VOCs. Acetone was non-detect in the original sample and detected at a concentration below the MRL at 78.2J ug/kg in the duplicate pair. All other TCL VOCs target compounds were non-detect. All criteria were met. No qualifiers were applied.

XI-Quantitation Verification

The accuracy of analytical results is verified through the calculation of several parameters. The percent difference (%D) between the calculated and the reported values should be within 10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J."

Sample: TB071907W (F51154-21), chloroform

Conc. (µg/L) = (Ax)*(Is) *(DF)/(Ais)*(RRF)

where: Ax is the compound area
Ais is the corresponding internal standard area
Is is the corresponding internal standard concentration (µg/L)
DF is the dilution factor
RRF is the relative response factor.

Conc. µg/L = (27317 * 50 µg/L * 1) / (2460609 * 0.423) = 1.3 µg/L

Reported Conc. = 1.3 µg/L
%D = 0.0%
Values were within 10% difference.

Sample: 41SD08 (F51154-9), methyl ethyl ketone

Conc. (µg/kg) = {(Ax)*(Is)*(DF)*(Vp)} / {(Ais)*(RRF)*(Ws)*Fs)}
where:
Ax is the compound area
Is is the corresponding internal standard concentration (ng/mL)
DF is the dilution factor
Vp is the volume purged (mL)
Ais is the corresponding internal standard area
RRF is the relative response factor
Ws is the weight of the sample (g)
Fs is the fraction solids for the sample

Conc. µg/kg = (73706 * 50 ng/mL * 1 * 5mL) / (919966 * 0.284 * 3.92g * 0.369) =
= 48.8 µg/kg

Reported Conc. = 48.8 µg/kg
%D = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Eric Malarek, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Dioxin Furans
SGS Paradigm Analytical Laboratories, Inc. SDGs G383-584
(Accutest SDG F51247)

DATE: November 30, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at Main Manufacturing Area at RFAAP for a RFI/CMS Nine Sites on July 23, 2007. The samples were analyzed for Dioxin Furan compounds using USEPA SW-846 Method 8290 High Resolution Gas Chromatography/High Resolution Mass Spectroscopy (HRGC/HRMS). A total of twenty solid samples were validated. The sample Ids are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
50SB06A	F51247-1	50SB011A	F51247-11
50SB06B	F51247-2	50SB011B	F51247-12
50SB07A	F51247-3	50SB012A	F51247-13
50SB07B	F51247-4	50SB012B	F51247-14
50SB08A	F51247-5	50SB013A	F51247-15
50SB08B	F51247-6	50SB013B	F51247-16
50SB09A	F51247-7	50SB014A	F51247-17
50SB09B	F51247-8	50SB014B	F51247-18
50SB010A	F51247-9	50SB015A	F51247-19
50SB010B	F51247-10	50SB015B	F51247-20

Data were reviewed and validated using a combination of project QAPP, *DOD Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *USEPA Region III Dioxin/Furan Data Validation Guidance* (March, 1999). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
X		Blank Analysis
	X	Instrument Performance Check
	X	Initial Calibration
	X	Continuing Calibration
	X	Internal Standards (IS) Recovery Standard Solutions
	X	Cleanup Standards
	X	Laboratory Control Standard or Ongoing Precision Result (OPR)
	X	Matrix Spike and Spike Duplicate
	X	Field Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

RFAAP VALIDATION REPORT
DIOXIN FURAN REVIEW
SDGs G383-584
(Accutest SDG F51247)

I-Holding Times and Preservation

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: For solid samples, dioxin and furans are shipped cooled (@4°C ± 2°C) with a maximum holding time of 30 days from sample collection to preparative extraction and 45 days from preparative extraction to determinative analysis.

- Temperature Review: The temperature blank was sent with each cooler and recorded by the laboratory upon receipt. For samples collected on 07/23/07, the coolers were received by the primary laboratory (Accutest) on 07/20/07 at 2.8°C, and 3.2°C. The herbicides were subcontracted to Accutest TX and were received the samples at 3.4°C. The dioxin subcontract laboratory (SGS Paradigm Analytical Laboratories, Inc.) received the samples at 1.2°C. Even though the receipt temperature was below criteria for some coolers, there were no impacts to the data quality. No qualifiers were applied based upon this outlier.

- Holding Time Review: The soil samples were collected on 07/23/07. The dioxins and furans were extracted on 07/31/07, 08/01/07, and 08/05/07 and analyzed on 08/01/07, 08/02/07, 08/03/07, and 08/08/07. Sample collection dates may be found on the attached form 1s. All criteria were met. No qualifiers were applied.

II-Blank Analysis

The purpose of laboratory (or field) blank analyses is to determine the existence and magnitude of contamination problems resulting from field and laboratory activities. No contamination should be found in any of the blanks >EDL (estimated detection limit). The DoD QSM criteria specifies all concentrations should be less than ½ MRL (<MRL for common laboratory contaminants OCDD and OCDF) and <2EDL for the calibration blanks. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants OCDD or OCDF, or 5 times (5X) the maximum amount for other target compounds. **Table 2** summarizes the blank contamination analysis. Action levels are based upon dilution factor of one and for solid matrices were converted to soil values (soil conversion factor = 100) if needed. Rinse blanks 072407R (F51275-1) and 072507R (F51300-31) apply to the surface soil "SS" and subsurface soil "SB" samples in this SDG.

Table 2 Blank Contamination Analysis Summary

J = Estimated value <MRL and >EDL.
EMPC = Estimated Maximum Possible Concentration.

III-Instrument Performance Check

Instrument must be tuned with perfluorokerosene (PFK) to achieve a static resolving power of at least 10,000 (10% valley) and lock-mass ion between lowest and highest masses for each descriptor and level of reference compound ≤10%. Documentation of the mass spectrometer resolving power is accomplished by recording the peak profile of the high-mass reference signal (typically m/z 330.9792) obtained during a peak examination by using the low-mass PFK ion at m/z 292.9825 or lower in mass as reference. At the beginning of the each 12-hour period, the chromatographic resolution is verified in the same fashion as in the initial calibration through the analysis of HRCC solution on the DB-5 (or equivalent) column or through the analysis of the column performance solution on the SP-2331 or SP-225 (or equivalent) column. A 25% valley must be achieved between the close eluters.

- All PFK forms were verified and found to be in compliance with method specification. No qualifiers were applied.

IV-Initial Calibration
Once the window defining mix has been analyzed and the descriptor switching times have been verified, the five point calibration solutions can be analyzed prior to sample analysis. Per method and DoD QSM, the initial calibration criteria are as follows:

- The percent relative standard deviations for the mean response factors RRF(n) from the 17 unlabeled standards must not exceed ±20%, and those for the labeled reference compounds must not exceed ±30%;
- The signal to noise ratio ≥10% for all target ions;
- Ion abundance ratios must be within the specified control limits in Table 8 (SW846 Method 8290).

- For initial calibration performed on 11/02/07 for all target compounds on instrument HRMS3, all criteria were met. No qualifiers were applied. Sample 50SB08A (F51247-5) applies to this initial calibration.

- For 2,3,7,8-TCDF initial calibration performed on 04/18/07 for all target compounds on instrument HRMS3, all criteria were met. No qualifiers were applied. 2,3,7,8-TCDF confirmations for samples 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB09B (F51247-8), and 50SB012B (F51247-14) apply to this initial calibration.

- For initial calibration performed on 07/10/07 for all target compounds on instrument HRMS1, all criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this initial calibration.

V-Continuing Calibration
The continuing calibration consists of two parts: evaluation of the mass resolution and retention time check. Per method and DoD QSM, the following stipulates the continuing calibration criteria.

- The signal signal-to-noise ratio (S/N) must be at least 10:1 for each selected ion current profile (SICP) and for each GC signal representing the elution of a target analyte or labeled standard for each analyte.
- The relative response factor of each analyte for the unlabeled standard must be within ±20% of the average RF obtained from the initial calibration, and the RRF of each labeled standard must be within ±30% of the average RRF established during initial calibration. This is expressed in term of percent difference %D.
- Ion abundance ratios must be within the specified control limits in Table 8 (SW846 Method 8290).

- For continuing calibration performed on 07/30/07 @17:04 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 07/31/07 @04:20 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 07/31/07 @13:17 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 08/01/07 @00:39 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 08/01/07 @10:25 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 08/01/07 @14:32 on instrument HRMS1, all criteria were met. No qualifiers were applied. Samples 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08B (F51247-6), 50SB09A (F51247-7), and 50SB09B (F51247-8) apply to this continuing calibration.

- For continuing calibration performed on 08/02/07 @01:54 on instrument HRMS1, all criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), and 50SB013B (F51247-16) apply to this continuing calibration.

- For continuing calibration performed on 08/02/07 @12:28 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 08/02/07 @16:03 on instrument HRMS1, all criteria were met. No qualifiers were applied. Samples 50SB014A (F51247-17), 50SB014B and (F51247-18) apply to this continuing calibration.

- For continuing calibration performed on 08/03/07 @03:24 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 08/03/07 @14:47 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 08/04/07 @13:46 on instrument HRMS1, all criteria were met. No qualifiers were applied. Samples 50SB015A (F51247-19) and 50SB015B (F51247-20) apply to this continuing calibration.

- For continuing calibration performed on 08/05/07 @01:03 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 08/08/07 @15:10 on instrument HRMS3, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 08/08/07 @14:36 on instrument HRMS3, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 08/09/07 @01:59 on instrument HRMS3, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 08/09/07 @13:23 on instrument HRMS3, all criteria were met. No qualifiers were applied. Sample 50SB08A (F51247-5) applies to this continuing calibration.

- For continuing calibration performed on 08/09/07 @22:34 on instrument HRMS3, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For continuing calibration performed on 08/10/07 @05:55 on instrument HRMS3, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For 2,3,7,8-TCDF continuing calibration performed on 08/11/07 @10:20 on instrument HRMS3, all criteria were met. No qualifiers were applied. 2,3,7,8-TCDF confirmations for samples 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB09B (F51247-8), and 50SB012B (F51247-14) apply to this continuing calibration.

- For 2,3,7,8-TCDF continuing calibration performed on 08/11/07 @19:53 on instrument HRMS3, all criteria were met. No qualifiers were applied. No samples reported apply to this continuing calibration.

VI-Internal Standards (IS) Recovery Standard Solutions
Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Specific criteria include: Recoveries of the isotopically-labeled recovery standards to fall within the 40 to 135 percent range for the tetra- through octachlorinated congeners, or as stated in the data package (DoD QSM limits 40-135%).

- All criteria were met. No qualifiers were applied.

VII-Cleanup Standards
Cleanup standards are added to every sample, blank, quality control sample, and calibration solution. This compound is added to the samples after extraction but prior to cleanup and is used to verify the percent recovery obtained using the isotope dilution technique. The control limits are 40 to 135 percent (DoD QSM limits 40-135%).

- All criteria were met. No qualifiers were applied.

VIII-Laboratory Control Standard (LCS) or Ongoing Precision Result (OPR)
LCSs are used to monitor laboratory accuracy and precision by calculating the percent recoveries of the spiked compounds. Per DOD QSM and method criteria, acceptable performance is determined by:

1. Recoveries of the isotopically-labeled extraction standards to fall within 40-135% control limits for the tetra- through octachlorinated congeners, or as stated in the data package;

2. Recoveries (accuracy) of the unlabeled compounds should be within ±35% when spiked at the method quantitation limit and within ±30% when spiked above 20 times the method quantitation limit, or as stated in the data package;

3. When duplicate OPR are required, the relative percent difference (RPD) of the unlabeled analytes concentrations should be within 30% when spiked at the method quantitation limit and within ±20% when spiked above 20 times the method quantitation limit.

- Sample OPR14389 was used as LCS and LCSD on 08/01/07 analytical run. All criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), and 50SB013B (F51247-16) apply to this LCS. The 2,3,7,8-TCDF confirmations for samples 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB09B (F51247-8), and 50SB012B (F51247-14) also apply to this LCS.

- Sample OPR14391 was used as LCS and LCSD on 08/04/07 analytical run. All criteria were met. No qualifiers were applied. Samples 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this LCS.

- Sample OPR14398 was used as LCS and LCSD on 08/09/07 analytical run. All criteria were met. No qualifiers were applied. Sample 50SB08A (F51247-5) applies to this LCS.

IX-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. Per DoD QSM, MS/MSD recoveries must be within in-house laboratory limits (75-125%) and RPD ≤20%.

- No project specific solid matrix MS/MSD was performed; therefore, it was not evaluated.

X-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No project specific solid field duplicate was analyzed with this SDG; therefore, it was not evaluated.

XI-Quantitation Verification

The accuracy of analytical results was verified through the calculation of at least one the several parameters such as the %D, %RSD, % recovery, and/or compound concentration. Values were found to be within 10%. Any value reported by the laboratory as estimated "A" based on an analyte to internal standard ratio below the calibration curve was qualified as estimated "J". The signal signal-to-noise ratio (S/N) must be greater than 2.5 for each selected ion current profile (SICP) and for each GC signal representing the elution of a target analyte or labeled standard. Any detected value with ether interference (I-lab flag) was qualified as estimated "J". For where the ion ratio failed the 25% criteria (*-lab flag), the estimated maximum possible concentration (EMPC) was reported and flagged estimated "J". For where presence of quantitation interference (Q-lab flag), the date was flagged estimated "J" for detects and "UJ" for non-detects.

- For sample 50SB06A (F51247-1), Total PeCDDs was qualified estimated "J" based upon the presence of quantitation interference.

- For sample 50SB06B (F51247-2), Total PeCDDs was qualified estimated "J" based upon the presence of quantitation interference.

- For sample 50SB07A (F51247-3), Total PeCDDs and Total PeCDFs were qualified estimated "J" based upon the presence of quantitation interference.

- For sample 50SB09B (F51247-8), 2,3,4,7,8-PeCDF, Total PeCDDs, and Total PeCDFs were qualified estimated "J" based upon the presence of quantitation interference.

- OCDD exceeded upper calibration limit for samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB08A (F51247-5), 50SB09A (F51247-7), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB014A (F51247-17), 50SB015A (F51247-19), and 50SB015B (F51247-20). OCDD was qualified estimated "J" for all associated samples based upon these outliers.

- 1,2,3,4,6,7,8-HpCDD exceeded upper calibration limit for samples 50SB06A (F51247-1) and 50SB012A (F51247-13). 1,2,3,4,6,7,8-HpCDD was qualified estimated "J" for all associated samples based upon these outliers.

Sample: 41SD09 (F51154-10), OCDD

A(x) = sum of the integrated ion abundances of the quantitation ions for the unlabeled ions;

A(is) = sum of the integrated ion abundances of the quantitation ions for the labeled ions;

Q(is) = quantity, in pg, of the internal standard added to the sample before extraction; Here need to multiply concentration (pg/uL) by final extract volume (uL).

W = weight, in g, of the sample (solid or organic liquid) as dry weight, or volume in mL of an aqueous sample; and

Avg. RRF(n) = calculated mean relative response factor for the unlabeled analyte.

$$\text{Conc. (ng/kg)} = \frac{(A(x))\ *Q(is)}{A(is) * W * \text{Avg. RRF}} = \frac{(3490000000+3900000000)*4.0*1000}{(26000000+28900000) * (11.35 * 0.8770) * 1.0783} =$$

= 50200 ng/kg = 50200 pg/g

Reported Value = 50200 pg/g
% Difference = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ EDL and <MRL or <3*EDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥EDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ EDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Eric Malarek, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Explosives, PETN, & Nitroglycerin
Accutest Laboratories, Inc., SDG F51247

DATE: December 10, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at collected at Main Manufacturing Area at RFAAP for a RFI/CMS Nine Sites on July 23, 2007. Solid samples were analyzed for explosives, nitroglycerin, and PETN using USEPA SW-846 8330A. A total of twenty solid samples were validated. The sample Ids are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
50SB06A	F51247-1	50SB011A	F51247-11
50SB06B	F51247-2	50SB011B	F51247-12
50SB07A	F51247-3	50SB012A	F51247-13
50SB07B	F51247-4	50SB012B	F51247-14
50SB08A	F51247-5	50SB013A	F51247-15
50SB08B	F51247-6	50SB013B	F51247-16
50SB09A	F51247-7	50SB014A	F51247-17
50SB09B	F51247-8	50SB014B	F51247-18
50SB010A	F51247-9	50SB015A	F51247-19
50SB010B	F51247-10	50SB015B	F51247-20

Data were reviewed by Eric Malarek and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Blank Analysis
	X	Initial Calibration
	X	Continuing Calibration
	X	System Monitoring Compounds
	X	Laboratory Control Sample
	X	Matrix Spike/Spike Duplicate
	X	Field Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

RFAAP VALIDATION REPORT
EXPLOSIVES REVIEW
SDG F51247

I-Holding Times and Preservation

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: For solid samples, explosive compounds are shipped cooled (@4°C ± 2°C) with a maximum holding time of 14 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: The temperature blank was sent with each cooler and recorded by the laboratory upon receipt. For samples collected on 07/23/07, the coolers were received by the primary laboratory (Accutest) on 07/20/07 at 2.8°C, and 3.2°C. The herbicides were subcontracted to Accutest TX and were received the samples at 3.4°C. The dioxin subcontract laboratory (SGS Paradigm Analytical Laboratories, Inc.) received the samples at 1.2°C. Even though the receipt temperature was below criteria for some coolers, there were no impacts to the data quality. No qualifiers were applied based upon this outlier.

- Holding Time Review: The solid samples were collected on 07/23/07. For the solid samples, the explosives were extracted on 08/06/07 and analyzed on 08/07/07 and 08/08/07. All criteria were met. No qualifiers were applied.

II-Blank Analysis

The purpose of laboratory or field blank analyses is to determine the existence and magnitude of contamination problems resulting from laboratory or field activities. One method blank per analytical batch must be run on each instrument used to analyze samples. No contaminants should be present in the blanks. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤5 times (5x) the maximum amount for explosive target compounds. **Table 2** summarizes the blank contamination analysis. Action levels are based upon dilution factor of one and for solid matrices were converted to soil values (soil conversion factor = 10) if needed. Rinse blanks 072407R (F51275-1) and 072507R (F51300-31) apply to the surface soil "SS" and subsurface soil "SB" samples in this SDG.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/kg	Action Level µg/kg	B qualified samples
08/07/07	OP21756-MB	All target explosives <½MRL	NA	NA	None
08/08/07	OP21756-MB	All target explosives <½MRL	NA	NA	None
08/08/07	OP21756-MB	All target explosives <½MRL	NA	NA	None
08/07/07	OP21756-MB	PETN & NG <½MRL	NA	NA	None
08/01/07	072407R	All target explosives <½MRL	NA	NA	None
08/01/07	072407R	PETN & NG <½MRL	NA	NA	None
08/01/07	072507R	All target explosives <½MRL	NA	NA	None
08/01/07	072507R	PETN & NG <½MRL	NA	NA	None

MRL = Method Reporting Limit
NA = Not Applicable

III-Initial Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. The initial 5-point calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run. The DoD QSM specifies that the correlation coefficient must be ≥0.995 and/or the percent relative standard deviation (%RSD) must be ≤20%. All detects were qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects were qualified as estimated "UJ" for where there were grossly exceeding recoveries. Grossly exceeding is defined as twice the established criteria limits.

- For the explosives initial calibration performed on 10/18/06 on instrument G1315B, all criteria were met for target explosives compounds. All compounds were determined using calibration factors with RSDs ≤20%. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this initial calibration.

- For the explosives initial calibration performed on 01/19/07 on instrument G1315B, all criteria were met for target explosives compounds. All compounds were determined using calibration factors with RSDs ≤20%. No qualifiers were applied. Confirmations for samples 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB012B (F51247-14), and 50SB014A (F51247-17) apply to this initial calibration.

- For the PETN and nitroglycerine initial calibration performed on 03/15/07 on instrument G1315B, all criteria were met for target compounds. All compounds were determined using calibration factors with RSDs ≤20%. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this initial calibration.

IV-Continuing Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. Continuing calibration standards are analyzed after every 10 injections, and at the end of the analysis sequence. The DoD QSM specifies that the percent difference (%D) from initial calibration should be no greater than ±20%. All detects were qualified as estimated "J" for where there were exceeding %Ds, and all non-detects were qualified as estimated "UJ" for where there were grossly exceeding recoveries. Grossly exceeding is defined as twice the established criteria limits.

- For explosives initial calibration verification performed on 10/18/06 @17:39 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples reported apply to this initial verification calibration.

- For explosives initial calibration verification performed on 10/19/06 @13:44 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples reported apply to this initial verification calibration.

- For explosives continuing calibration performed on 08/07/07 @19:18 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), and 50SB09A (F51247-7) apply to this continuing calibration.

- For explosives continuing calibration performed on 08/08/07 @00:22 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), and 50SB012B (F51247-14) apply to this continuing calibration.

- For explosives continuing calibration performed on 08/08/07 @05:25 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For explosives continuing calibration performed on 08/08/07 @13:48 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this continuing calibration.

- For explosives continuing calibration performed on 08/08/07 @18:51 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For explosives initial calibration verification performed on 01/19/07 @14:58 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples reported apply to this initial verification calibration.

- For explosives continuing calibration performed on 08/08/07 @11:46 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Confirmations for samples 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB012B (F51247-14), and 50SB014A (F51247-17) apply to this continuing calibration.

- For explosives continuing calibration performed on 08/08/07 @15:08 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For PETN and nitroglycerin initial calibration verification performed on 03/15/07 @12:35 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For PETN and nitroglycerin continuing calibration performed on 08/07/07 @15:38 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), and 50SB08B (F51247-6) apply to this continuing calibration.

- For PETN and nitroglycerin continuing calibration performed on 08/07/07 @17:03 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), and 50SB012B (F51247-14) apply to this continuing calibration.

- For PETN and nitroglycerin continuing calibration performed on 08/07/07 @18:31 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this continuing calibration.

- For PETN and nitroglycerin continuing calibration performed on 08/07/07 @19:39 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples reported apply to this continuing calibration.

V-System Monitoring Compound (Surrogates)
Laboratory performance on individual samples is established by means of spiking activities. The percent recovery (%R) for all samples and blanks must be within the laboratory control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Criteria:	3,4-dinitrotoluene (70-136%)
Solid Criteria:	3,4-dinitrotoluene (72-145%)

- All criteria were met for explosives, PETN, and nitroglycerin. No qualifiers were applied.

VI-Laboratory Control Sample
Laboratory control samples (LCS) are used to monitor long-term accuracy of the analytical method. The analysis is performed at a frequency of 1 per analytical batch. The percent recoveries (%Rs) must be within the laboratory control limits. DoD QSM solid LCS recovery limits are specified in Table D-2 and Table D-13 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP21756-BS was used as solid LCS for explosives analyzed on 08/07/07. All criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this LCS.

- Sample OP22176-BS was used as solid LCS for explosives analyzed on 08/08/07. HMX (138%) was outside DoD QSM criteria and within laboratory criteria. HMX was non-detect for all associated samples; therefore, no qualifiers were applied based upon this outlier. Confirmations for samples 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB012B (F51247-14), and 50SB014A (F51247-17) apply to this LCS.

- Sample OP21756-BS2 was used as solid LCS for PETN and nitroglycerin analyzed on 08/07/07. All criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this LCS.

VII-Matrix Spike/Matrix Spike Duplicate

Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the laboratory control limits. DoD QSM solid MS/MSD recovery limits follow the LCS criteria and are specified in Table D-2 and Table D-13 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample APSD01 (F51154-18) was used as the solid MS/MSD for the explosive analysis on 08/08/07. 2,6-Dinitrotoluene (RPD=18%) was outside DoD QSM criteria and/or laboratory criteria. The spiked sample was non-detect for this compound; therefore, no qualifiers were applied based upon this outlier. The associated LCS (Section VI) was within criteria. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this MS/MSD.

- Sample 50SB09A (F51247-7) was used as the solid MS/MSD for the PETN and nitroglycerin analysis on 08/07/07. All criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this MS/MSD.

VIII-Field Duplicate Sample Analysis

Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No project specific solid field duplicate was analyzed with this SDG; therefore, it was not evaluated.

IX-Quantitation Verification
The accuracy of analytical results was verified through the calculation of several parameters. The calculation was based calibration factors. The absolute percent difference (%D) between the calculated and the reported value must be within 10% difference. All values >MDL and <MRL or <3*MDL (whichever was greater) were qualified as estimated "J".

- The %D between the primary and secondary columns was within criteria for all detected explosives, PETN, and nitroglycerin.

Sample: 50SB06B (F51247-2), 2,4,6-trinitrotoluene

Conc. µg/kg = (Ax * Vt * DF) / (CF * Ws * D)

where: Conc. = Sample concentration in µg/kg
Ax = Area of characteristic ion for compound being measured.
Vt = Volume of total extract (mL).
CF = Average relative calibration factor for compound being measured (from ICAL)
W(s) = Weight of sample in kilograms.
D = Percent dry weight (100 - % moisture in sample)/100 (Air dried =1)
DF = Dilution factor

Conc. µg/kg = (72962 * 20 * 1) / (7320 * 2.16 * 1) = 92.3 µg/kg (Signal #1)
Reported Value = 92.3 µg/kg
% Difference = 0.0%
Values were within 10% difference

Sample: 50SB09AMS (F51247-7MS), nitroglycerin

Conc. µg/kg = (Ax * Vt * DF) / (CF * Ws * D)

where: Conc. = Sample concentration in µg/kg
Ax = Area of characteristic ion for compound being measured.
Vt = Volume of total extract (mL).
CF = Average relative calibration factor for compound being measured (from ICAL)
W(s) = Weight of sample in kilograms.
D = Percent dry weight (100 - % moisture in sample)/100
DF = Dilution factor

Conc. µg/kg = (3335480 * 20 * 1) / (1228 * 2.12 * 1) = 25600 µg/kg (Signal #1)
Reported Value = 25600 µg/kg
% Difference = 0.0%
Values were within 10% difference

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I RFAAP Project Manager

FROM: Eric Malarek, Shaw E&I RFAAP Project Chemist

SUBJECT: Radford Army Ammunition Plant (RFAAP) Data Validation – Herbicides
Accutest Laboratories, Inc., SDG F51247

DATE: December 11, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at Main Manufacturing Area at RFAAP for a RFI/CMS Nine Sites on July 23, 2007. Solid samples were analyzed for chlorinated herbicides using USEPA SW846 Method 3550B/8151A. A total of twenty solid samples were validated. The sample Ids are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
50SB06A	F51247-1	50SB011A	F51247-11
50SB06B	F51247-2	50SB011B	F51247-12
50SB07A	F51247-3	50SB012A	F51247-13
50SB07B	F51247-4	50SB012B	F51247-14
50SB08A	F51247-5	50SB013A	F51247-15
50SB08B	F51247-6	50SB013B	F51247-16
50SB09A	F51247-7	50SB014A	F51247-17
50SB09B	F51247-8	50SB014B	F51247-18
50SB010A	F51247-9	50SB015A	F51247-19
50SB010B	F51247-10	50SB015B	F51247-20

Data were reviewed by Eric Malarek and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times
X		Initial Calibration
X		Continuing Calibration
	X	Blank Analysis
	X	System Monitoring Compounds
	X	Laboratory Control Sample
	X	Matrix Spike/Spike Duplicate
	X	Field Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Eric Malarek, Chemist

RFAAP VALIDATION REPORT
CHLORINATED HERBICIDES REVIEW
SDG F51247

I-Holding Times

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: For solid samples, chlorinated herbicides compounds are shipped cooled (@4°C ± 2°C) with a maximum holding time of 14 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: The temperature blank was sent with each cooler and recorded by the laboratory upon receipt. For samples collected on 07/23/07, the coolers were received by the primary laboratory (Accutest) on 07/20/07 at 2.8°C, and 3.2°C. The herbicides were subcontracted to Accutest TX and were received the samples at 3.4°C. The dioxin subcontract laboratory (SGS Paradigm Analytical Laboratories, Inc.) received the samples at 1.2°C. Even though the receipt temperature was below criteria for some coolers, there were no impacts to the data quality. No qualifiers were applied based upon this outlier.

- Holding Time Review: The solid samples were collected on 07/23/07. For solid samples, the herbicides were extracted on 07/26/07 and analyzed on 07/29/07 and 07/30/07. All criteria were met. No qualifiers were applied.

II-Initial Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The DoD QSM specifies that the percent relative standard deviation (%RSD) for a 5-point standard calibration should be ≤20% for each target compound.

- No initial calibration was provided for MCPP and MCPA on instrument GC-GG. During discussions with the laboratory, they indicated that they perform a daily single point calibration rather than a five point calibration. All samples were non-detect and qualified estimated "UJ" based upon this outlier. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this single point calibration.

- For initial calibration performed on 07/29/07 on instrument GC-GG, all criteria were met for signal #1 and signal #2 for all target compounds, except MCPP and MCPA. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this initial calibration.

III-Continuing Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Continuing calibration establishes the response factors on which the quantitations are based and checks satisfactory performance of the instrument on a day-to-day basis. The DoD QSM specifies that the percent difference (%D) between the initial calibration CF and the continuing calibration CF must be ≤20%.

- A single point calibration was provided for MCPP and MCPA on instrument GC-GG for 07/29/07 run. The calibration standard indicated adequate response for MCPP and MCPA. However, since a five point calibration was not performed, %D calculation could not be verified. All samples were non-detect and qualified estimated "UJ" based upon this outlier. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this single point calibration.

- For initial calibration standard performed on 07/29/07 @15:00 on instrument GC-GG, all criteria were met for signal #1 and signal #2 for all target compounds, except MCPP and MCPA. See Section II for initial calibration discussion. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), and 50SB08B (F51247-6) apply to this continuing calibration.

- For continuing calibration performed on 07/29/07 @22:40 on instrument GC-GG, all criteria were met for signal #1 and signal #2 for all target compounds, except MCPP and MCPA. No qualifiers were applied. Samples 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), and 50SB013B (F51247-16) apply to this continuing calibration.

- For continuing calibration performed on 07/30/07 @04:04 on instrument GC-GG, all criteria were met for signal #1 and signal #2 for all target compounds, except MCPP and MCPA. No qualifiers were applied. Samples 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this continuing calibration.

- For continuing calibration performed on 07/30/07 @06:46 on instrument GC-GG, all criteria were met for signal #1 and signal #2 for all target compounds, except MCPP and MCPA. . No qualifiers were applied. No samples reported apply to this continuing calibration.

IV-Blank Analysis
The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field or laboratory activities. No contaminants should be detected in any of the associated blanks. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are qualified "B" if the concentration of the analyte is ≤ five times (5x) the absolute maximum blank concentration. **Table 2** summarizes the blank contamination analysis. Action levels are based upon dilution factor of one and for solid matrices were converted to soil values (soil conversion factor = 33) if needed. Rinse blanks 072407R (F51275-1) and 072507R (F51300-31) apply to the surface soil "SS" and subsurface soil "SB" samples in this SDG.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/kg	Action Level µg/kg	B qualified samples
07/29/07	OP7763-MB	All target compounds <½MRL	NA	NA	None
08/03/07	072407R	All target compounds <½MRL	NA	NA	None
08/03/07	072507R	All target compounds <½MRL	NA	NA	None

MRL = Method Reporting Limit.
NA = Not Applicable.

V-System Monitoring Compounds (Surrogates)
Laboratory performance on individual samples is established by means of spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. Spike recoveries must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Solid Control Limit: 2,4-DCAA (34-179%)

- All criteria were met. No qualifiers were applied.

VI-Laboratory Control Samples
Data for laboratory control samples (LCS) are generated to determine long-term precision and accuracy of the analytical method. Percent recoveries must be within the specified control limits. DoD QSM solid LCS recovery limits are specified in Table D-2 and Table D-9 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP7763-BS was used as the solid LCS for the 07/29/07 run. All criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this LCS.

VII-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD QSM solid MS/MSD recovery limits follow the LCS criteria and are specified in Table D-2 and Table D-9 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample 50SB011A (F51247-11) was used as the solid MS/MSD for the 07/30/07 run. 2,4-D (RPD=36%), 2,4,5-TP (RPD=51%), 2,4,5-T (RPD=42%), dinoseb (61%, RPD=200%), and dichloroprop (RPD=27%) were above DoD QSM criteria and/or laboratory criteria. The LCS was within criteria (Section VI) for all herbicides. All samples were non-detect for 2,4-D, 2,4,5-TP, 2,4,5-T, dinoseb, and dichloroprop; therefore, no qualifiers were applied based upon these outliers. All other herbicides were within criteria. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this MS/MSD.

VIII-Field Duplicate Sample Analysis

Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were qualified because of blank contamination (B-qualified) or were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No project specific solid field duplicate was analyzed with this SDG; therefore, it was not evaluated.

IX-Quantitation Verification

The accuracy of analytical results is verified through the calculation of several parameters. Percent difference (%D) between the calculated value and the reported value must be within 10%. All positive values must have less than or equal to 40% %D between the primary and secondary columns. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J."

- The %D between the primary and secondary columns was within criteria for all detected chlorinated herbicides.

Sample: 50SB010B (F51247-10), dicamba

Conc. µg/kg = (Amt * Ve * DF) / (CF * Ws * D)

where: Amt = the response on column (µg/mL) of the sample
CF = Calibration Factor (from initial calibration)
Ve = Final Volume of extract (mL)
DF = Dilution factor
W(s) = Weight of sample in grams.
D = Percent dry weight (100 - % moisture in sample)/100

Conc. µg/kg = (1398115 * 10 * 1) / (43400* 30.3 * 0.7660) = 13.9 µg/kg

Reported value = 13.9 µg/kg
%D = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

A (Dioxins) = MDL is based upon the signal-to-noise measurement.

B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics and Dioxins) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

D (Organics) = Indicates sample was analyzed at a dilution.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

E (Dioxins) = Reported value is estimated because of the presence of ether interferences.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/F ions is outside accepted ranges. The detected PCDD/F is reported as an estimated maximum possible concentration (EMPC).

I (Dioxins) = Reported value is estimated because of the incorrect isotope rations were obtained.

J (All) = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, (2) estimating a concentration <MRL and ≥ MDL, or estimating a concentration below the calibration range.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

U (All) = ND = BQL = Not detected. The associated number indicates the compound reporting limit for the sample.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Eric Malarek, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – TAL Metals
Accutest Laboratories, Inc., SDG F51247

DATE: December 10, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at Main Manufacturing Area at RFAAP for a RFI/CMS Nine Sites on July 23, 2007. Solid samples were analyzed for target analyte list (TAL) metals using USEPA SW-846 3050B/6010B for ICP metals and SW-846 7471A for mercury. A total of twenty solid samples were validated. The sample Ids are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
50SB06A	F51247-1	50SB011A	F51247-11
50SB06B	F51247-2	50SB011B	F51247-12
50SB07A	F51247-3	50SB012A	F51247-13
50SB07B	F51247-4	50SB012B	F51247-14
50SB08A	F51247-5	50SB013A	F51247-15
50SB08B	F51247-6	50SB013B	F51247-16
50SB09A	F51247-7	50SB014A	F51247-17
50SB09B	F51247-8	50SB014B	F51247-18
50SB010A	F51247-9	50SB015A	F51247-19
50SB010B	F51247-10	50SB015B	F51247-20

Data were reviewed by Eric Malarek and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Inorganic Data Review* (April, 1993). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times
X		Initial and Continuing Calibration
X		Blank Analysis
	X	ICP Interference Check Sample (ICS)
	X	Laboratory Control Sample (LCS)
X		Laboratory Sample Duplicate
X		Matrix Spike and Spike Duplicate
X		ICP Serial Dilution
	X	Field Sample Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

RFAAP VALIDATION REPORT
METALS REVIEW
SDG F51247

I-Holding Times

The primary objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample analysis. Holding time criteria: For solid matrices, the samples are shipped cool @4°C±2°C with a maximum holding time is 180 days for ICP metals and 28 days for mercury.

- Temperature Review: The temperature blank was sent with each cooler and recorded by the laboratory upon receipt. For samples collected on 07/23/07, the coolers were received by the primary laboratory (Accutest) on 07/20/07 at 2.8°C, and 3.2°C. The herbicides were subcontracted to Accutest TX and were received the samples at 3.4°C. The dioxin subcontract laboratory (SGS Paradigm Analytical Laboratories, Inc.) received the samples at 1.2°C. Even though the receipt temperature was below criteria for some coolers, there were no impacts to the data quality. No qualifiers were applied based upon this outlier.

- Holding Time Review: Samples were collected 07/23/07 for metals analysis. For solid samples, they were digested on 07/30/07 and analyzed on 07/30/07 and 07/31/07 (Fe, Mn, Ca, Cr, and Cu) for ICP metals. Mercury was digested on 07/26/07 and analyzed on 07/26/07. All criteria were met. No qualifiers were applied.

II-Initial and Continuing Calibration

Requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable quantitative data. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of the analysis run, and continuing calibration verification documents that the initial calibration is still valid.

ICP:	1- blank (DoD QSM <½ MRL) 3 – standards (r≥0.995) ICV/CCV (90-110%) (DoD QSM 90-110%) MRL (70-130%) (DoD QSM 80-120%) High Std. (95-105%)	Hg:	1 – blank (DoD QSM <½ MRL) 5 – standards (r≥0.995) ICV/CCV (80-120%)(DoD QSM ICV 90-110% & CCV 80-120%) MRL (80-120%) (DoD QSM 80-120%) High Std. (95-105%)

- The solid samples were analyzed for ICP metals on 07/30/07 and 07/31/07 (Fe, Mn, Ca, Cr, and Cu) for ICP metals. Mercury was analyzed for the solid samples on 07/26/07 with a correlation coefficient of 0.9998. All ICV/CCV/High Standard criteria were met for all metals and runs. **Table 2** summarizes the MRL standard analysis. Samples with concentrations detected less than two times the MRL with out of criteria MRL recovery were qualified.

Table 2 MRL Analysis Summary

Analysis Date	Analysis	MRL (mg/kg)	MRL %Recovery	Qualified samples @ <2xMRL	Validation Qualifiers
07/30/07	ICP-Sb	3.0	34.0%	50SB010A, 50SB010B, 50SB011A, 50SB011B, 50SB012A, 50SB012B, 50SB013A, 50SB013B, 50SB014A, 50SB014B, 50SB015A, 50SB015B, 50SB06A, 50SB06B, 50SB07A, 50SB07B, 50SB08A, 50SB08B, 50SB09A, 50SB09B	L, UL

07/26/07	Hg	0.083	All within criteria	None	None

III-Blanks

Blanks (preparation and calibration blanks) are assessed to determine the existence and magnitude of contamination problems. No contaminants should be detected (i.e. <MDL) in any of the associated blanks. DoD QSM limits are <½MRL for the method blank and <2*MDL for the calibration blanks. Samples are qualified "B" when they are less than 5x the absolute value of the maximum blank concentration. **Table 3** summarizes the blank contamination analysis. Action levels are based upon dilution factor of one and for solid matrices were converted to soil values (soil conversion factor = 10 for ICP and Hg = 12) if needed. Rinse blanks 072407R (F51275-1) and 072507R (F51300-31) apply to the surface soil "SS" and subsurface soil "SB" samples in this SDG.

Table 3 Blank Contamination Analysis Summary

Analysis Date	Analysis	QC Blank ID	Max Conc. mg/kg	Action Level mg/kg	B qualified samples

07/28/07	Mercury	072507R	<2*MDL	NA	None

J = Estimated value <MRL and >MDL. Data point qualified was estimated "J".
NA = Not Applicable
MDL = Method Detection Limit.

IV-ICP Interference Check Sample (ICS)
The ICP interference check sample (ICS) verifies interelement and background correction factors. ICP Interference Check is performed at the beginning and end of each sample analysis run. Control limits are 80-120% (DoD QSM limits 80-120%).

- All criteria were met. No qualifiers were applied.

V-Laboratory Control Samples (LCS)
The laboratory control sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. All aqueous LCS results must fall within the control limits. The DoD QSM solid LCS recovery limits are specified in Table D-19 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample MP12604-BS was used as solid LCS for ICP metals analysis on 07/30/07. All criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this LCS.

- Sample MP12574-BS was used as solid LCS for mercury analysis on 07/26/07. All criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), and 50SB013B (F51247-16) apply to this LCS.

- Sample MP12575-BS was used as solid LCS for mercury analysis on 07/26/07. All criteria were met. No qualifiers were applied. Samples 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this LCS.

VI-Laboratory Duplicate Sample Analysis
Duplicate sample determinations are used to demonstrate acceptable method precision by the laboratory at the time of analysis. Duplicate analyses are also performed to generate data in order to determine the long-term precision of the analytical method on various matrices. RPDs must be within established control limits. DoD QSM limits for metals are 20% RPD for ICP metals and mercury.

- Sample 50SB06A (F51247-1) was used as solid laboratory duplicate for ICP metals analysis on 07/30/07. Arsenic (26.2%) and chromium (32.7%) were above criteria. All other metals were within criteria. Arsenic and chromium were qualified estimated "J" based upon the high RPDs. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this laboratory duplicate.

- Sample 59SS08 (F51154-29) was used as solid laboratory duplicate for mercury analysis on 07/26/07. All criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), and 50SB013B (F51247-16) apply to this laboratory duplicate.

- Sample 50SB014A (F51247-17) was used as soil laboratory duplicate for mercury analysis on 07/26/07. All criteria were met. No qualifiers were applied. Samples 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this laboratory duplicate.

VII-Matrix Spike/Spike Duplicate
MS/MSD are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. Specific criteria include the analyses of matrix spike and matrix spike duplicate samples at a frequency of one MS and MSD per 20 samples of similar matrix. MS and MSD recoveries and relative percent differences between MS and MSD recoveries should be within the specified limits. DoD QSM solid MS/MSD recovery limits follow the LCS criteria and are specified in Table D-19 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used. Post digestion spikes limits are 75-125% for ICP metals and mercury.

- Sample 50SB06A (F51247-1) was used as solid laboratory MS/MSD for ICP metals analysis on 07/30/07. Aluminum (73.1%, 153%), antimony (16.5%, 14.4%), arsenic (68.3%, 75.9%), cadmium (68.2%, 71.8%), calcium (412%, 362%), chromium (-31.4%, -0.09%), cobalt (76.1%), iron (-96.6%), magnesium (259%, 178%), manganese (-197%, 266%; RPD=21.6%), nickel (78.6%), selenium (62.4%, 69.5%), thallium (76.9%, 78.7%), vanadium (70.3%), and zinc (70.7%) were outside criteria. The sample concentration was >4 times the spike added for aluminum, iron, and manganese; therefore, no qualifiers were applied based upon these outliers. Antimony, arsenic, cadmium, chromium, cobalt, nickel, selenium, thallium, vanadium, and zinc were qualified bias low "L" for detects and "UL" for non-detects based upon the low recoveries. Calcium and magnesium were qualified bias high "K" for detects and no qualifier for non-detects based upon the high recoveries. All other metals were within criteria. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this MS/MSD.

- Sample 59SS08 (F51154-29) was used as solid MS/MSD for mercury analysis on 07/26/07. All criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), and 50SB013B (F51247-16) apply to this MS/MSD.

- Sample 50SB014A (F51247-17) was used as solid MS/MSD for mercury analysis on 07/26/07. All criteria were met. No qualifiers were applied. Samples 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this MS/MSD.

VIII-ICP Serial Dilution

An ICP serial dilution is performed to determine whether significant physical or chemical interferences exist due to sample matrix at high concentrations. An analysis of a 5-fold dilution should agree within 10% difference of the original result when the concentration in sample is a factor of 50 above MDL.

- The serial dilution for ICP metals was analyzed on 07/30/07 using solid sample 50SB06A (F51247-1). Aluminum (13.0%), antimony (11.8%), arsenic (29.1%), barium (10.8%), beryllium (22.5%), calcium (22.3%), chromium (19.4%), cobalt (21.6%), iron (20.6%), lead (21.8%), magnesium (19.4%), manganese (24.4%), nickel (23.2%), potassium (32.5%), selenium (39.5%), vanadium (17.4%), and zinc (29.0%) were outside of criteria limits. Sample concentrations were <50 times MDL for antimony, arsenic, and beryllium; therefore, no qualifiers were applied based upon these outliers. For aluminum, barium, calcium, chromium, cobalt, iron, lead, magnesium, manganese, nickel, potassium, selenium, vanadium, and zinc, all detects were qualified estimated "J" and non-detects no qualifier based upon these outliers. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this serial dilution.

- The serial dilution for mercury was analyzed using solid sample 59SS08 (F51154-29) on 07/26/07. Mercury (34.5%) was above criteria. Sample concentration was <50 times MDL for mercury; therefore, no qualifiers were applied based upon this outlier. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), and 50SB013B (F51247-16) apply to this serial dilution.

- The serial dilution for mercury was analyzed using solid sample 50SB014A (F51247-17) on 07/26/07. All criteria were met. No qualifiers were applied. Samples 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this serial dilution.

IX-Field Duplicate Sample Analysis

Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 35% RPD for the solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No project specific solid field duplicate was analyzed with this SDG; therefore, it was not evaluated.

X-Quantitation Verification

The accuracy of analytical results is verified through the calculation of several parameters. The percent difference (%D) between the calculated and the reported values should be within 10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J." The following calculations were performed for verification.

ICP Sample: 50SB06A (F51247-1), Barium

Conc. (mg/kg) = {(conc. μg/L)*(Final Volume L)*(DF)} / {(Weight Sample g)*(Fraction Solids)}

Conc. (mg/kg) = {(1772 μg/L)*(0.050 L)*(1)} / {(1.05 g)*(0.8880)} = 95.0 μg/g = 95.0 mg/kg

Reported concentration = 95.0 mg/kg
%D = 0.0%
Values were within 10% difference.

Hg Sample: 50SB06A (F51247-1), Mercury

Conc. (mg/kg) = {(conc. μg/L)*(Final Volume L)*(DF)} / {(Weight Sample g)*(Fraction Solids)}

Conc. (mg/kg) = {(0.677 μg/L)*(0.050 L)*(1)} / {(0.67 g)*(0.8880)} = 0.057 μg/g = 0.057 mg/kg

Reported concentration = 0.057 mg/kg
%D = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

D = Indicates sample was analyzed at a dilution.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

N (Metals) = Laboratory spike sample recovery not within control limits.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Eric Malarek, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Pesticides and PCBs
Accutest Laboratories, Inc., SDG F51247

DATE: December 7, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at Main Manufacturing Area at RFAAP for a RFI/CMS Nine Sites on July 23, 2007. Solid samples were analyzed for pesticides and PCBs using USEPA Method 3550B/8081A and 3550B/8082, respectively. A total of twenty solid samples were validated. The sample Ids are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
50SB06A	F51247-1	50SB011A	F51247-11
50SB06B	F51247-2	50SB011B	F51247-12
50SB07A	F51247-3	50SB012A	F51247-13
50SB07B	F51247-4	50SB012B	F51247-14
50SB08A	F51247-5	50SB013A	F51247-15
50SB08B	F51247-6	50SB013B	F51247-16
50SB09A	F51247-7	50SB014A	F51247-17
50SB09B	F51247-8	50SB014B	F51247-18
50SB010A	F51247-9	50SB015A	F51247-19
50SB010B	F51247-10	50SB015B	F51247-20
50SB06A	F51247-1	50SB011A	F51247-11

Data were reviewed by Eric Malarek and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Instrument Performance Check
	X	Initial Calibration
	X	Continuing Calibration
	X	Blank Analysis
X		System Monitoring Compounds
X		Laboratory Control Samples
X		Matrix Spike/Spike Duplicate
	X	Field Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

RFAAP VALIDATION REPORT
PESTICIDE/PCB REVIEW
SDG F51247

I-Holding Times and Preservation
The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: For aqueous samples, pesticide and PCB compounds are shipped cooled (@4°C ± 2°C) with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis. For solid samples, pesticide and PCB compounds are shipped cooled (@4°C ± 2°C) with a maximum holding time of 14 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: The temperature blank was sent with each cooler and recorded by the laboratory upon receipt. For samples collected on 07/23/07, the coolers were received by the primary laboratory (Accutest) on 07/20/07 at 2.8°C, and 3.2°C. The herbicides were subcontracted to Accutest TX and were received the samples at 3.4°C. The dioxin subcontract laboratory (SGS Paradigm Analytical Laboratories, Inc.) received the samples at 1.2°C. Even though the receipt temperature was below criteria for some coolers, there were no impacts to the data quality. No qualifiers were applied based upon this outlier.

- Holding Time Review: The solid samples were collected on 07/23/07. The pesticides were extracted on 07/31/07 and analyzed on 08/07/07, 08/08/07, and 08/10/07. The PCBs were extracted on 07/31/07 and analyzed on 08/02/07, 08/03/07, 08/04/07, and 08/06/07. All criteria were met. No qualifiers were applied.

II-Instrument Performance Check (Degradation Standard)
Performance checks on the gas chromatograph with electron capture detector (GC/ECD) system are performed to ensure adequate resolution and instrument sensitivity. The performance evaluation mixture (PEM) must be analyzed at the beginning of the analytical sequence. The breakdown of Endrin and 4,4'-DDT must be ≤15% on both signals.

- For analysis performed on 08/04/07 @09:09, endrin and 4,4'-DDT percent breakdowns were 14.1% and 5.0% on signal #1 and 13.8% and 4.5% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- For analysis performed on 08/06/07 @14:48, endrin and 4,4'-DDT percent breakdowns were 8.0% and 3.0% on signal #1 and 9.2% and 2.4% on signal #2, respectively. All criteria were met. No qualifiers were applied.

III-Initial Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. The initial 5 point calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run. Calibration factors are generated for each compound. The DoD QSM specifies that the percent relative standard deviation (%RSD) for all single peak target analytes, and aroclors 1016, 1242, 1254, and 1260 must be <20% or the mean %RSD for all analytes in the standard must be ≤20%. If linear regression is used, the correlation coefficient must be ≥0.995. All detects are qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits.

- For the pesticide initial calibration performed on 08/04/07 on instrument ECD5, all criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) were analyzed using this initial calibration.

- For the pesticide initial calibration performed on 08/10/07 on instrument ECD6, all criteria were met. No qualifiers were applied. Sample 50SB012A (F51247-13) was analyzed using this initial calibration.

- For the PCB initial calibration performed on 07/28/07 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples were analyzed using this initial calibration.

- For the PCB initial calibration performed on 08/02/07 on instrument ECD3, PCB1221-A (24.1%) and PCB1221-B (37.3%) were outside criteria for signal #1. For signal #2, PCB1221-A (33.7%) was outside criteria. For signal #1, compounds PCB1221-A (r=0.9974), PCB1221-B (r=0.9938), PCB1221-C (r=0.9992), PCB1221-D (r=0.9995), and PCB1221-E (r=0.9992) were quantified using linear or second order regression with correlation coefficients >0.995. For signal #2, compounds PCB1221-A (r=0.9941), PCB1221-B (r=0.9985), PCB1221-C (r=0.9996), PCB1221-D (r=0.9997), and PCB1221-E (r=0.9996) were quantified using linear or second order regression with correlation coefficients >0.995. Therefore, no qualifiers were applied based upon these outliers. Samples 50SB06A (F51247-1), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) were analyzed using this initial calibration.

- For the PCB initial calibration performed on 08/06/07 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples 50SB06B (F51247-2), 50SB07A (F51247-3), and 50SB012B (F51247-14) were analyzed using this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for pesticide/PCB target compounds. Continuing calibration standards containing both target compounds and surrogates are analyzed at the beginning of each 12-hour analytical shift and after every 20 samples. The DoD QSM specifies that the percent difference (%D) or the average %Ds for all analytes in the standard from the initial calibration should be no greater than ±20%.

- For pesticide initial calibration verification performed on 08/04/07 @12:47 on instrument ECD5, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this initial calibration verification.

- For pesticide continuing calibration performed on 08/06/07 @16:34 on instrument ECD5, all criteria were met for signal #1 and for the signal #2. No qualifiers were applied. Sample 50SB09A (F51247-7) was analyzed using this continuing calibration.

- For pesticide continuing calibration performed on 08/06/07 @19:50 on instrument ECD5, all criteria were met for signal #1 and for the signal #2. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For pesticide continuing calibration performed on 08/06/07 @22:45 on instrument ECD5, all criteria were met for signal #1 and for the signal #2. No qualifiers were applied. Sample 50SB08A (F51247-5) was analyzed using this continuing calibration.

- For pesticide continuing calibration performed on 08/07/07 @12:53 on instrument ECD5, all criteria were met for signal #1 and for the signal #2. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For pesticide continuing calibration performed on 08/07/07 @11:26 on instrument ECD5, all criteria were met for signal #1 and for the signal #2. No qualifiers were applied. Samples 50SB08B (F51247-6), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB013A (F51247-15), and 50SB013B (F51247-16) were analyzed using this continuing calibration.

- For pesticide chlordane continuing calibration performed on 08/07/07 @11:57 on instrument ECD5, all criteria were met for signal #1 and for the signal #2. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For pesticide toxaphene continuing calibration performed on 08/07/07 @12:13 on instrument ECD5, all criteria were met for signal #1 and for the signal #2. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For pesticide continuing calibration performed on 08/07/07 @15:32 on instrument ECD5, all criteria were met for signal #1 and for the signal #2. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) were analyzed using this continuing calibration.

- For pesticide continuing calibration performed on 08/07/07 @18:12 on instrument ECD5, 4,4'-DDD (21.5%), 4,4'-DDT (36.6%), and methoxychlor (31.0%) were outside criteria for the signal #1. 4,4'-DDT (40.6%) and methoxychlor (35.0%) were outside criteria for the signal #2. No samples reported was analyzed using this continuing calibration; therefore, no qualifiers were applied based upon these outliers.

- For pesticide continuing calibration performed on 08/08/07 @11:16 on instrument ECD5, all criteria were met for signal #1 and for the signal #2. No qualifiers were applied. Samples 50SB07B (F51247-4), 50SB08A (F51247-5), and 50SB09A (F51247-7) were analyzed using this continuing calibration.

- For pesticide chlordane continuing calibration performed on 08/08/07 @11:32 on instrument ECD5, all criteria were met for signal #1 and for the signal #2. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For pesticide toxaphene continuing calibration performed on 08/08/07 @11:48 on instrument ECD5, all criteria were met for signal #1 and for the signal #2. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For pesticide continuing calibration performed on 08/08/07 @13:34 on instrument ECD5, all criteria were met for signal #1 and for the signal #2. No qualifiers were applied. Samples 50SB07A (F51247-3) and 50SB012B (F51247-14) were analyzed using this continuing calibration.

- For pesticide continuing calibration performed on 08/10/07 @18:40 on instrument ECD6, all criteria were met for signal #1 and for the signal #2. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For pesticide initial calibration verification performed on 08/10/07 @22:05 on instrument ECD6, all criteria were met. No qualifiers were applied. Sample 50SB012A (F51247-13) were analyzed using this initial calibration verification.

- For pesticide continuing calibration performed on 08/10/07 @23:09 on instrument ECD6, all criteria were met for signal #1 and for the signal #2. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For PCB 1016/1260 initial calibration verification performed on 08/02/07 @12:49 on instrument ECD3, PCB1254-F (22.0%) was outside criteria for signal #1; however, the average %D for PCB1254 was 14.2%. PCB1254-E (21.0%) was outside criteria for signal #2. The average %D for PCB1254 was 13.4% for signal #2. PCB1221-E (98.6%) was outside criteria for signal %1. PCB1221-A (95.9%) and PCB-1221-E (98.7%) were outside criteria for signal #2. No samples were analyzed using this initial calibration verification.

- For PCB 1016/1260 continuing calibration performed on 08/02/07 @14:54 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB07B (F51247-4), 50SB08A (F51247-5), and 50SB09A (F51247-7) were analyzed using this continuing calibration.

- For PCB 1016/1260 continuing calibration performed on 08/02/07 @15:28 on instrument ECD3, PCB1016-C (21.6%) was outside criteria for signal #1; however, the average %D for PCB1016 was 10.2%. No qualifiers were applied based upon this outlier. All criteria were met for signal #2. No samples reported were analyzed using this continuing calibration.

- For PCB 1248 continuing calibration performed on 08/02/07 @15:45 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For PCB 1242 continuing calibration performed on 08/02/07 @16:02 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For PCB 1232/1268 continuing calibration performed on 08/02/07 @16:19 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For PCB 1221/1254 continuing calibration performed on 08/02/07 @16:36 on instrument ECD3, PCB1221-B (24.8%) was outside criteria for signal #1; however, the average %D for PCB1221 was 6.9%. No qualifiers were applied based upon this outlier. All criteria were met for signal #2. No samples reported were analyzed using this continuing calibration.

- For PCB 1016/1260 continuing calibration performed on 08/02/07 @19:43 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB013A (F51247-15), and 50SB013B (F51247-16) were analyzed using this continuing calibration.

- For PCB 1016/1260 continuing calibration performed on 08/02/07 @23:08 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) were analyzed using this continuing calibration.

- For PCB 1016/1260 continuing calibration performed on 08/03/07 @00:50 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For PCB 1016/1260 continuing calibration performed on 08/04/07 @06:08 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples 50SB08B (F51247-6) and 50SB09B (F51247-8) were analyzed using this continuing calibration.

- For PCB 1016/1260 continuing calibration performed on 08/04/07 @08:24 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

- For PCB 1016/1260 initial calibration verification performed on 08/06/07 @15:56 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples 50SB06B (F51247-2), 50SB07A (F51247-3), and 50SB012B (F51247-14) were analyzed using this initial calibration verification.

- For PCB 1016/1260 continuing calibration performed on 08/06/07 @19:06 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples reported were analyzed using this continuing calibration.

V-Blank Analysis

The purpose of laboratory or field blank analyses is to determine the existence and magnitude of contamination problems resulting from laboratory or field activities. One method blank per analytical batch must be run on each instrument used to analyze samples. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤5 times (5X) the maximum amount for pesticide and PCB target compounds. **Table 2** summarizes the blank contamination analysis. Action levels are based upon dilution factor of one and for solid matrices were converted to soil values (soil conversion factor = 33) if needed. Rinse blanks 072407R (F51275-1) and 072507R (F51300-31) apply to the surface soil "SS" and subsurface soil "SB" samples in this SDG.

Table 2 Blank Contamination Analysis Summary

Parameter	Analysis Date	QC Blank ID	Compound	Max Conc. µg/kg	Action Level µg/kg	B qualified samples
Pesticides	08/06/07	OP21686-MB	All target <½MRL	NA	NA	None
Pesticides	08/08/07	OP21686-MB	All target <½MRL	NA	NA	None
Pesticides	08/10/07	OP21686-MB	All target <½MRL	NA	NA	None
Pesticides	07/02/07	072407R	All target <½MRL	NA	NA	None
Pesticides	07/02/07	072507R	All target <½MRL	NA	NA	None
PCBs	08/02/07	OP21687-MB	All target <½MRL	NA	NA	None
PCBs	08/04/07	OP21687-MB	All target <½MRL	NA	NA	None
PCBs	08/06/07	OP21687-MB	All target <½MRL	NA	NA	None
PCBs	06/27/07	072407R	All target <½MRL	NA	NA	None
PCBs	06/27/07	072507R	All target <½MRL	NA	NA	None

NA = Not Applicable
MRL = Method Reporting Limit

VI-System Monitoring Compound (Surrogates)
Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Surrogate spikes are added to all samples and blanks to measure their recovery in sample and blank matrices. The percent recoveries (%Rs) must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Solid Criteria:	Tetrachloro-m-xylene:	Pesticides: 46-122% (DoD QSM 70-125%)
	Decachlorobiphenyl:	Pesticides: 50-133% (DoD QSM 55-130%)
Solid Criteria:	Tetrachloro-m-xylene:	PCBs: 44-126% (DoD QSM Not Listed)
	Decachlorobiphenyl:	PCBs: 39-157% (DoD QSM 60-125%)

- For pesticides sample 50SB06A (F51247-1), tetrachloro-m-xylene (65.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For pesticides sample 50SB06B (F51247-2), tetrachloro-m-xylene (66.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For pesticides sample 50SB07A (F51247-3), tetrachloro-m-xylene (64.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. The sample was diluted 10x and since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For pesticides sample 50SB07B (F51247-4), tetrachloro-m-xylene (49.0%) and decachlorobiphenyl (50.0%) were below DoD QSM criteria and within laboratory criteria. All detects were qualified "L" and non-detects "UL" based upon the low recoveries.

- For pesticides sample 50SB08A (F51247-5), tetrachloro-m-xylene (46.0%) and decachlorobiphenyl (44.0%) were below DoD QSM criteria and/or laboratory criteria. All detects were qualified "L" and non-detects "UL" based upon the low recoveries. Sample was re-analyzed at a 10x dilution for confirmation (run #2). For the confirmation, tetrachloro-m-xylene (60.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since the confirmation run was run at a 10x dilution and only one surrogate was outside criteria, no qualifiers were applied based upon this outlier for run #2.

- For pesticides sample 50SB08B (F51247-6), tetrachloro-m-xylene (54.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For pesticides sample 50SB09A (F51247-7), tetrachloro-m-xylene (52.0%) and decachlorobiphenyl (48.0%) were below DoD QSM criteria and/or laboratory criteria. All detects were qualified "L" and non-detects "UL" based upon the low recoveries. Sample was re-analyzed at a 10x dilution for confirmation (run #2) and all criteria were met.

- For pesticides sample 50SB09B (F51247-8), tetrachloro-m-xylene (51.0%) and decachlorobiphenyl (52.0%) were below DoD QSM criteria and/or laboratory criteria. All detects were qualified "L" and non-detects "UL" based upon the low recoveries.

- For pesticides sample 50SB010A (F51247-9), tetrachloro-m-xylene (59.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For pesticides sample 50SB010B (F51247-10), tetrachloro-m-xylene (63.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For pesticides sample 50SB011A (F51247-11), tetrachloro-m-xylene (55.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For pesticides sample 50SB011B (F51247-12), tetrachloro-m-xylene (60.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For pesticides sample 50SB012B (F51247-14), tetrachloro-m-xylene (69.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. The sample was analyzed at a 10x dilution and since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For pesticides sample 50SB013A (F51247-15), tetrachloro-m-xylene (57.0%) and decachlorobiphenyl (52.0%) were below DoD QSM criteria and/or laboratory criteria. All detects were qualified "L" and non-detects "UL" based upon the low recoveries.

- For pesticides sample 50SB013B (F51247-16), tetrachloro-m-xylene (56.0%) and decachlorobiphenyl (53.0%) were below DoD QSM criteria and/or laboratory criteria. All detects were qualified "L" and non-detects "UL" based upon the low recoveries.

- For pesticides sample 50SB014A (F51247-17), tetrachloro-m-xylene (59.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For pesticides sample 50SB014B (F51247-18), tetrachloro-m-xylene (63.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For pesticides sample 50SB015A (F51247-19), tetrachloro-m-xylene (56.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For pesticides sample 50SB015B (F51247-20), tetrachloro-m-xylene (68.0%) was below DoD QSM criteria and within laboratory criteria. Decachlorobiphenyl was within criteria. Since only one surrogate was outside criteria, no qualifiers were applied based upon this outlier.

- For PCBs sample 50SB07A (F51247-3), tetrachloro-m-xylene (0.0%) and decachlorobiphenyl (0.0%) surrogates were diluted out. The sample was analyzed at a 20x dilution. No qualifiers were applied based upon these outliers.

- For all other samples, all criteria were met for pesticides and PCBs analysis.

VII-Laboratory Control Samples

Laboratory control samples (LCS) are used to monitor laboratory accuracy by calculating the percent recoveries of the spiked compounds. All LCS percent recoveries must be within the specified control limits. DoD QSM solid LCS recovery limits are specified in Table D-15 and Table D-17 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP21686-BS was used as the solid LCS for the pesticide analysis on 08/06/07. Compound endrin aldehyde (12%) was outside DoD QSM criteria, however within laboratory criteria. Compound endrin aldehyde was non-detect for all associated samples and was qualified estimated bias "UL" for non-detects based upon very low recovery. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this LCS.

- Sample OP21687-BS was used as the solid LCS for the PCB analysis on 08/02/07. All criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this LCS.

- Sample OP21687-BS was used as the solid LCS for the PCB analysis on 08/06/07. All criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this LCS.

VIII-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD solid MS/MSD recovery limits follow the LCS criteria and are specified in Table D-15 and Table D-17 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample 50SB014A (F51247-17) was used as the MS/MSD for the pesticide analysis on 08/07/07. Compounds aldrin (54%; RPD=37%), alpha-BHC (49%; RPD=39%), beta-BHC (65%, 51%; RPD=26%), delta-BHC (35%, 28%), gamma-BHC (52%; RPD=40%), alpha chlordane (58%), gamma chlordane (61%), dieldrin (61%), 4,4'-DDE (66%), 4,4'-DDT (61%), endosulfan sulfate (58%, 50%), endrin aldehyde (7%; RPD=109%), endosulfan I (63%; RPD=26), endosulfan II (69%), heptachlor (57%; RPD=42%), heptachlor epoxide (59%; RPD=26%), and methoxychlor (67%) were outside DoD QSM criteria and/or laboratory criteria. The LCS was also low in recovery (See Section VII), except for endrin aldehyde. Compound endrin aldehyde was qualified "UL" for all samples based upon the low recovery. Compounds aldrin, alpha-BHC, beta-BHC, delta-BHC, gamma-BHC, alpha chlordane, gamma chlordane, dieldrin, 4,4'-DDE, 4,4'-DDT, endosulfan sulfate, endosulfan I, endosulfan II, heptachlor, heptachlor epoxide, and methoxychlor were non-detect for the spiked sample and qualified estimated bias low "UL" for non-detects based upon low recoveries. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this MS/MSD.

- Sample 50SB011B (F51247-12) was used as the MS/MSD for the PCB analysis on 08/02/07. All criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this MS/MSD.

IX-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No project specific solid field duplicate was analyzed with this SDG; therefore, it was not evaluated.

X-Quantitation Verification
The accuracy of analytical results was verified through the calculation of several parameters. The difference between the calculated value and the reported value must be within 10% difference. All positive values must have less than or equal to 40% %D between the primary and secondary columns. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J." All criteria were met.

- All chlorinated pesticides were non-detect. No confirmations were required.

- For all detected PCBs, the %Ds (average %D for multi-peak compounds) between the primary and secondary columns were within criteria. No qualifiers were applied.

Sample: 50SB014AMS (F51247-17MS), alpha-chlordane

Conc. µg/kg = (Ax * Vt * DF) / (CF * Vi * Ws * D)

where: Conc. = Sample concentration in µg/kg
Ax = Area/response for compound being measured.
Vt = Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10000 µL.
CF = Ave calibration response factor for compound being measured from ICAL (Area/pg)
Vi = Volume of extract injected (mL).
W(s) = Weight of sample extracted or diluted in grams.
D = Percent dry weight (100 - % moisture in sample)/100 = 1.0 for Wet Weight
DF = Dilution factor

Conc. µg/kg = (7431266Area*10000µL*1) / (200100Area/pg*(1000pg/ng)*1 µL*30.3g*0.9030) = 13.6 µg/kg

Reported Value = 13.6 µg/kg
% Difference = 0.0%
Values were within 10% difference

Sample: 50SB06B (F51247-2), Aroclor 1254

Conc. µg/kg = (Ax * Vt * DF) / (CF * Vi * Ws * D)

where: Conc. = Sample concentration in µg/kg
Ax = Area/response for compound being measured.
Vt = Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10000 µL.
CF = Ave calibration response factor for compound being measured from ICAL (Area/pg)
Vi = Volume of extract injected (µL).
W(s) = Weight of sample extracted or diluted in grams.
D = Percent dry weight (100 - % moisture in sample)/100 = 1.0 for Wet Weight
DF = Dilution factor

Signal #1
Conc1 µg/kg = (727512*10000*5) / (7463*(1000)*1*30.1*0.5960) = 271.70 µg/kg

Conc6 µg/kg = (202338*10000*5) / (1579*(1000)*1*30.1*0.5960) = 357.15 µg/kg
Average concentration = 311 µg/kg

Reported Value = 323 µg/kg (signal #1)
% Difference = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

N (Metals) = Laboratory spike sample recovery not within control limits.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

12672-29-6	Aroclor 1248	ND	18	9.0	ug/kg	
11097-69-1	Aroclor 1254	10.4 J	18	9.0	ug/kg	J
11096-82-5	Aroclor 1260	ND	18	9.0	ug/kg	

CAS No.	Surrogate Recoveries	Run# 1	Run# 2	Limits
877-09-8	Tetrachloro-m-xylene	80%		44-126%
2051-24-3	Decachlorobiphenyl	84%		39-157%

(a) All hits confirmed by dual column analysis.

ND = Not detected MDL - Method Detection Limit
RL = Reporting Limit
E = Indicates value exceeds calibration range
J = Indicates an estimated value
B = Indicates analyte found in associated method blank
N = Indicates presumptive evidence of a compound

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Eric Malarek, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Semi-Volatiles & Polynuclear Aromatic Hydrocarbons Accutest Laboratories, Inc., SDG F51247

DATE: December 3, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at Main Manufacturing Area at RFAAP for a RFI/CMS Nine Sites on July 23, 2007. Samples were analyzed for semivolatile organic compounds (SVOCs) using USEPA SW846 Methods 3550B/8270C for solid matrices. The polynuclear aromatic hydrocarbons (PAHs) were analyzed using selective ion monitoring (SIM) techniques. A total of twenty solid samples were validated. The sample Ids are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
50SB06A	F51247-1	50SB011A	F51247-11
50SB06B	F51247-2	50SB011B	F51247-12
50SB07A	F51247-3	50SB012A	F51247-13
50SB07B	F51247-4	50SB012B	F51247-14
50SB08A	F51247-5	50SB013A	F51247-15
50SB08B	F51247-6	50SB013B	F51247-16
50SB09A	F51247-7	50SB014A	F51247-17

50SB010A	F51247-9	50SB015A	F51247-19
50SB010B	F51247-10	50SB015B	F51247-20

Data were reviewed by Eric Malarek and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Instrument Performance Check
	X	Initial Calibration
	X	Continuing Calibration
	X	Blank Analysis
X		Surrogate Spikes
	X	Internal Standards
X		Laboratory Control Sample
X		Matrix Spike/Spike Duplicate
	X	Field Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

RFAAP VALIDATION REPORT
SEMIVOLATILES AND PAH REVIEW
SDG F51247

I-Holding Times and Preservation
The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: For semivolatile (SVOC) and polynuclear aromatic hydrocarbons (PAH) compounds in solid matrices, the samples are cooled @4°C ± 2°C with a maximum holding time of 14 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: The temperature blank was sent with each cooler and recorded by the laboratory upon receipt. For samples collected on 07/23/07, the coolers were received by the primary laboratory (Accutest) on 07/20/07 at 2.8°C, and 3.2°C. The herbicides were subcontracted to Accutest TX and were received the samples at 3.4°C. The dioxin subcontract laboratory (SGS Paradigm Analytical Laboratories, Inc.) received the samples at 1.2°C. Even though the receipt temperature was below criteria for some coolers, there were no impacts to the data quality. No qualifiers were applied based upon this outlier.

- Holding Time Review: The soil samples were collected 07/23/07. For samples 50SB07A (F51247-3) and 50SB08B (F51247-6), the SVOCs were extracted on 08/07/07 and analyzed on 08/08/07 and 08/10/07. Samples 50SB07A (F51247-3) and 50SB08B (F51247-6) were extracted one day out of holding time for SVOCs. No qualifiers were applied based upon these outliers. For the remaining samples, the SVOCs were extracted on 07/31/07 and analyzed on 08/01/07 and 08/02/07. For samples 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB08B (F51247-6), 50SB010B (F51247-10), 50SB012B (F51247-14), the PAHs by SIM were extracted on 08/07/07 and analyzed on 08/11/07, 08/15/07, and 08/17/07. Samples 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB08B (F51247-6), 50SB010B (F51247-10), 50SB012B (F51247-14) were extracted one day out of holding time for PAHs by SIM. No qualifiers were applied based upon these outliers. For the remaining samples, the PAHs by SIM were extracted on 07/31/07 and analyzed on 08/03/07 and 08/04/07. No qualifiers were applied based upon this outlier. Sample collection dates may be found on the attached form 1s. All criteria were met. No qualifiers were applied.

II-Instrument Performance Check
GC/MS instrument performance checks are performed to ensure mass resolution, identification and, to some degree, sensitivity. The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed.

- The instrument performance check, decafluorotriphenylphosphine (DFTPP), met the ion abundance criteria. No qualification was applied.

III-Initial Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for compounds on the semivolatile target compound list (TCL). Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. For compounds analyzed using linear regression or second order, correlation coefficients must be >0.995 and coefficients of determination >0.99. The minimum relative response factor (RRF) criteria must be ≥0.05. The DoD QSM specifies that the initial calibration percent relative standard deviation (%RSD) must be ≤15% on the average for all compounds (<30% for CCCs). All detects are qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- Initial calibration for the SVOCs was performed on 07/05/07 on instrument MSBNA02. Target compounds 2,4-dinitrophenol (19.7%) and 4,6-dinitro-2-methylphenol (25.9%) were outside criteria. All other target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). Compounds 2,4-dinitrophenol (r=0.9950) and 4,6-dinitro-2-methylphenol (r=0.9975) were quantified using linear or second order regression with correlation coefficients >0.995, therefore, no qualifiers were applied based upon the high %RSDs. Samples 50SB012A (F51247-13 confirmation), 50SB012B (F51247-14 confirmation), 50SB010B (F51247-10 confirmation), 50SB012B (F51247-14 confirmation), and 50SB06B (F51247-2 confirmation) were analyzed using this initial calibration.

- Initial calibration for the SVOCs was performed on 07/13/07 on instrument MSBNA04. Target compounds 2,4-dinitrophenol (42.0%; grossly exceeding) and 4,6-dinitro-2-methylphenol (24.0%) were outside criteria. All other target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). Compounds 2,4-dinitrophenol (r=0.9988) and 4,6-dinitro-2-methylphenol (r=0.9995) were quantified using linear or second order regression with correlation coefficients >0.995, therefore, no qualifiers were applied based upon the high %RSDs. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) were analyzed using this initial calibration.

- Initial calibration for the PAHs by SIM was performed on 07/18/07 on instrument MSBNA03, all target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) were analyzed using this initial calibration.

- Initial calibration for the PAHs by SIM was performed on 08/07/07 on instrument MSBNA01, all target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). No qualifiers were applied. Samples 50SB010B (F51247-10) and 50SB012B (F51247-14) were analyzed using this initial calibration.

- Initial calibration for the PAHs by SIM was performed on 08/15/07 on instrument MSBNA01, all target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). No qualifiers were applied. Samples 50SB06B (F51247-2), 50SB07A (F51247-3), and 50SB08B (F51247-6) were analyzed using this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used was capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Continuing calibration standards containing both target and surrogates compounds are analyzed at the beginning of each 12-hour analysis period following the analysis of the instrument performance check and prior to the analysis of blanks and samples. The minimum relative response factors (RRF) for semivolatile target compounds and surrogates must be ≥0.05. The DoD QSM specifies that the percent difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within ±20% for all target compounds. Grossly exceeding is defined where %D>40%. All detects are qualified as estimated "J" for where there were exceeding %Ds, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- For SVOC initial calibration verification performed on 07/05/07 @15:27 on instrument MSBNA02, 3-nitroaniline (26.0%) was outside criteria limits. For all other target compounds, all criteria were met. All samples were non-detect for 3-nitroaniline. No qualifiers were applied. No samples reported apply to this initial calibration verification.

- For SVOC initial calibration verification performed on 07/05/07 @15:55 on instrument MSBNA02, all criteria were met for all target compounds. No qualifiers were applied. No samples reported apply to this initial calibration verification.

- For SVOC continuing calibration performed on 08/02/07 @13:24 on instrument MSBNA02, all criteria were met for all target compounds. No qualifiers were applied. Samples 50SB012A (F51247-13 confirmation) and 50SB012B (F51247-14 confirmation) apply to this continuing calibration.

- For SVOC continuing calibration performed on 08/08/07 @10:46 on instrument MSBNA02, all criteria were met for all target compounds. No qualifiers were applied. Samples 50SB08B (F51247-6), 50SB010B (F51247-10 confirmation), and 50SB012B (F51247-14 confirmation) apply to this continuing calibration.

- For SVOC continuing calibration performed on 08/13/07 @12:13 on instrument MSBNA02, all criteria were met for all target compounds. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For SVOC continuing calibration performed on 08/13/07 @19:50 on instrument MSBNA02, all criteria were met for all target compounds. No qualifiers were applied. Sample 50SB06B (F51247-2 confirmation) applies to this continuing calibration.

- For SVOC initial calibration verification performed on 07/13/07 @13:48 on instrument MSBNA04, 4-chloroaniline (38.2%) and 3-nitroaniline (39.0%) were outside criteria limits. For all other target compounds, all criteria were met. All samples were non-detect for 4-chloroaniline and 3-nitroaniline. No samples reported apply to this initial calibration verification. No qualifiers were applied.

- For SVOC initial calibration verification performed on 07/13/07 @14:19 on instrument MSBNA04, all criteria were met for all target compounds. No qualifiers were applied. No samples reported apply to this initial calibration verification.

- For SVOC continuing calibration performed on 08/01/07 @13:41 on instrument MSBNA04, all criteria were met for all target compounds. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this continuing calibration.

- For SVOC continuing calibration performed on 08/10/07 @10:24 on instrument MSBNA04, 2,4-dinitrophenol (20.8%) was outside criteria limits. For all other target compounds, all criteria were met. All samples were non-detect for 2,4-dinitrophenol. Sample 50SB07A (F51247-3) applies to this continuing calibration.

- For PAH by SIM initial calibration verification performed on 07/18/07 @06:34 on instrument MSBNA03, all criteria were met for all target compounds. No qualifiers were applied. No samples reported apply to this initial calibration verification.

- For PAH by SIM continuing calibration performed on 08/03/07 @20:42 on instrument MSBNA03, all criteria were met for all target compounds. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this continuing calibration.

- For PAH by SIM initial calibration verification performed on 08/07/07 @18:49 on instrument MSBNA01, all criteria were met for all target compounds. No qualifiers were applied. No samples reported apply to this initial calibration verification.

- For PAH by SIM initial calibration verification performed on 08/07/07 @19:17 on instrument MSBNA01, all criteria were met for all target compounds. No qualifiers were applied. No samples reported apply to this initial calibration verification.

- For PAH by SIM continuing calibration performed on 07/30/07 @11:52 on instrument MSBNA01, all criteria were met for all target compounds. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For PAH by SIM continuing calibration performed on 08/10/07 @15:52 on instrument MSBNA01, all criteria were met for all target compounds. No qualifiers were applied. Samples 50SB010B (F51247-10) and 50SB012B (F51247-14) apply to this continuing calibration.

- For PAH by SIM continuing calibration performed on 08/13/07 @10:12 on instrument MSBNA01, all criteria were met for all target compounds. No qualifiers were applied. No samples reported apply to this continuing calibration.

- For PAH by SIM initial calibration verification performed on 08/15/07 @13:54 on instrument MSBNA01, all criteria were met for all target compounds. No qualifiers were applied. No samples reported apply to this initial calibration verification.

- For PAH by SIM initial calibration verification performed on 08/15/07 @14:21 on instrument MSBNA01, all criteria were met for all target compounds. No qualifiers were applied. No samples reported apply to this initial calibration verification.

- For PAH by SIM continuing calibration performed on 08/15/07 @16:26 on instrument MSBNA01, all criteria were met for all target compounds. No qualifiers were applied. Sample 50SB06B (F51247-2) applies to this continuing calibration.

- For PAH by SIM continuing calibration performed on 08/17/07 @00:39 on instrument MSBNA01, all criteria were met for all target compounds. No qualifiers were applied. Samples 50SB07A (F51247-3) and 50SB08B (F51247-6) apply to this continuing calibration.

V-Blank Analysis

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. A method blank analysis must be performed after the calibration standards and once every 12-hour time period beginning with the injection of DFTPP. No contaminants should be detected in any of the associated blanks > the MDL. DoD QSM criteria specifies all concentrations should be less than one-half MRL (<MRL for common laboratory contaminants phthalate esters). Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants phthalate esters, or 5 times (5X) the maximum amount for other semivolatile target compounds. **Table 2** summarizes the blank contamination analysis. Action levels are based upon dilution factor of one and for solid matrices were converted to soil values (soil conversion factor = 33) if needed. Rinse blanks 072407R (F51275-1) and 072507R (F51300-31) apply to the surface soil "SS" and subsurface soil "SB" samples in this SDG.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/kg	Action Level µg/kg	B qualified samples
08/01/07	OP21689-MB	All SVOC target <½MRL	NA	NA	None
08/02/07	OP21689-MB	All SVOC target <½MRL	NA	NA	None
08/08/07	OP21773-MB	All SVOC target <½MRL	NA	NA	None
08/10/07	OP21773-MB	All SVOC target <½MRL	NA	NA	None
08/13/07	OP21773-MB	All SVOC target <½MRL	NA	NA	None
08/13/07	OP21773-MB	All SVOC target <½MRL	NA	NA	None
08/03/07	OP21688-MB	All PAH SIM target <½MRL	NA	NA	None
08/10/07	OP21772-MB	All PAH SIM target <½MRL	NA	NA	None
08/13/07	OP21772-MB	All PAH SIM target <½MRL	NA	NA	None
08/15/07	OP21772-MB	All PAH SIM target <½MRL	NA	NA	None
08/17/07	OP21772-MB	All PAH SIM target <½MRL	NA	NA	None
08/02/07	072407R	All SVOC target <½MRL	NA	NA	None
08/02/07	072407R	All PAH SIM target <½MRL	NA	NA	None
08/02/07	072507R	All SVOC target <½MRL	NA	NA	None
08/02/07	072507R	All PAH SIM target <½MRL	NA	NA	None

NA = Not applicable.
MRL = Method reporting limit.

VI-Surrogate Spikes
Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Surrogate spikes are added to all samples and blanks to measure their recovery in sample and blank matrices. The percent recoveries (%Rs) must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-2 and Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Solid Criteria:
2-Fluorophenol (40-102%) – (DoD QSM = 35-105%)
Phenol – d5 (41-100%) – (DoD QSM = 40-100%)
2,4,6-Tribromophenol (42-108%) – (DoD QSM = 35-125%)
Nitrobenzene-d5 (40-105%) – (DoD QSM = 35-100%)
2-Fluorobiphenyl (43-107%) – (DoD QSM = 45-105%)
p-Terphenyl – d14 (45-119%) – (DoD QSM = 30-125%)

- For soil sample 50SB06B (F51247-2), 2-fluorophenol (36.0%), phenol – d5 (37.0%), 2,4,6-tribromophenol (34.0%), nitrobenzene-d5 (35.0%), 2-fluorobiphenyl (37.0%), and p-terphenyl – d14 (37.0%) were outside lab criteria and/or DoD QSM criteria. The sample was diluted due to matrix effects. The sample was re-extracted and rerun beyond holding times at a further dilution for confirmation with the following recoveries: 2-fluorophenol (9.0%), phenol – d5 (11.0%), 2,4,6-tribromophenol (0.0%), nitrobenzene-d5 (10.0%), 2-fluorobiphenyl (11.0%), and p-terphenyl – d14 (9.0%). Sample 50SB06B (F51247-2) was qualified bias low "UL" based upon the noted matrix effects and the low surrogate recoveries.

- For soil sample 50SB07A (F51247-3), 2-fluorophenol (28.0%), phenol – d5 (34.0%), 2,4,6-tribromophenol (24.0%), nitrobenzene-d5 (28.0%), 2-fluorobiphenyl (32.0%), and p-terphenyl – d14 (29.0%) were outside lab criteria and/or DoD QSM criteria. The sample was diluted due to matrix effects. Sample 50SB07A (F51247-3) was qualified bias low "L" for detects and "UL" for non-detects based upon the noted matrix effects and the low surrogate recoveries.

- For soil sample 50SB010B (F51247-10), 2-fluorophenol (11.0%), phenol – d5 (16.0%), nitrobenzene-d5 (9.0%), and 2-fluorobiphenyl (14.0%) were outside lab criteria and/or DoD QSM criteria. The sample was re-extracted and rerun beyond holding times for confirmation with all recoveries within criteria. Sample 50SB010B (F51247-10) was qualified bias low "UL" based upon the low surrogate recoveries.

- For soil sample 50SB012B (F51247-14), 2-fluorophenol (19.0%), phenol – d5 (20.0%), 2,4,6-tribromophenol (22.0%), nitrobenzene-d5 (20.0%), 2-fluorobiphenyl (24.0%), and p-terphenyl – d14 (25.0%) were outside lab criteria and/or DoD QSM criteria. The sample was diluted due to matrix effects. The sample was re-extracted and rerun beyond holding times for confirmation with the following recoveries: 2-fluorophenol (16.0%), phenol – d5 (16.0%), 2,4,6-tribromophenol (0.0%), nitrobenzene-d5 (23.0%), 2-fluorobiphenyl (29.0%), and p-terphenyl – d14 (27.0%). Sample 50SB012B (F51247-14) was qualified bias low "L" for detects and "UL" for non-detects based upon the noted matrix effects and the low surrogate recoveries.

- For all other field samples, all surrogates were within criteria limits.

VII-Internal Standards
Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Internal standard area counts for samples and blanks must not vary by more than a factor of two (-50% to +100%) from the associated calibration standard. The retention time of the internal standards in samples and blanks must not vary by more than ±30 seconds from the retention time of the associated calibration standard.

- All criteria were met. No qualifiers were applied.

VIII-Laboratory Control Sample

Laboratory control samples (LCS) are used to monitor laboratory accuracy by calculating the percent recoveries of the spiked compounds. All LCS percent recoveries must be within the specified control limits. DoD LCS solid recovery limits are specified in Table D-2 and Table D-7 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP21689-BS was used as the solid LCS for the SVOC analysis on 08/01/07. All criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this LCS.

- Sample OP21773-BS was used as the solid LCS for the SVOC analysis on 08/08/07. All criteria were met. No qualifiers were applied. Samples 50SB07A (F51247-3) and 50SB08B (F51247-6) apply to this LCS.

- Sample OP21773-BS was used as the solid LCS for the SVOC analysis on 08/10/07. All criteria were met. No qualifiers were applied. Samples 50SB07A (F51247-3) and 50SB08B (F51247-6) apply to this LCS.

- Sample OP21773-BS was used as the solid LCS for the SVOC analysis on 08/13/07. 2,4-Dinitrophenol (35%) and 4,6-dinitro-2-methylphenol (52%) were below laboratory criteria. The associated samples were non-detect for these compounds and was qualified bias low "UL" based upon the low recoveries. Samples 50SB07A (F51247-3) and 50SB08B (F51247-6) apply to this LCS.

- Sample OP21688-BS was used as the solid LCS for the PAH SIM analysis on 08/03/07. All criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this LCS.

- Sample OP21772-BS was used as the solid LCS for the PAH SIM analysis on 08/10/07. All criteria were met. No qualifiers were applied. Samples 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB08B (F51247-6), 50SB010B (F51247-10), and 50SB012B (F51247-14) apply to this LCS.

- Sample OP21772-BS was used as the solid LCS for the PAH SIM analysis on 08/13/07. All criteria were met. No qualifiers were applied. Samples 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB08B (F51247-6), 50SB010B (F51247-10), and 50SB012B (F51247-14) apply to this LCS.

IX-Matrix Spike/Matrix Spike Duplicate

Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD solid MS/MSD recovery limits follow the LCS criteria and are specified in Table D-2 and Table D-7 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample 50SB010A (F51247-9) was used for the solid MS/MSD for SVOC analysis on 08/01/07. 2,4-Dimethylphenol (46%, 42%) and 3,3'-dichlorobenzidine (16%, 12%) were below laboratory and/or DoD QSM accuracy criteria. All other target compounds were within criteria. The associated solid LCS was within criteria and all solid samples were non-detect for these compounds. 2,4-Dimethylphenol and 3,3'-dichlorobenzidine were non-detect for the spiked sample and qualified "UL" based upon the low recoveries. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this MS/MSD.

- Sample APSB08B (F51353-27) was used for the solid MS/MSD for SVOC analysis on 07/30/07. 2,4-Dimethylphenol (36%, 30%), 4,6-dinitro-2-methylphenol (52%, 49%), 1,2-dichlorobenzene (44%), 1,3-dichlorobenzene (39%), 1,4-dichlorobenzene (40%), and hexachloroethane (39%) were below laboratory and/or DoD QSM accuracy criteria. All other target compounds were within criteria. The associated solid LCS was within criteria and all solid samples were non-detect for these compounds. 2,4-Dimethylphenol, 4,6-dinitro-2-methylphenol, 1,2-dichlorobenzene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, and hexachloroethane were non-detect for the spiked sample and qualified "UL" based upon the low recoveries. Samples 50SB07A (F51247-3) and 50SB08B (F51247-6) apply to this MS/MSD.

- Sample 50SB014A (F51247-17) was used for the solid MS/MSD for PAH SIM analysis on 08/04/07. Acenaphthene (43%; RPD=37%), acenaphthylene (43%; RPD=40%), anthracene (62%), chrysene (63%), fluorene (51%; RPD=29%), 1-methylnaphthalene (38%; RPD=50%), 2-methylnaphthalene (36%; RPD=51%), naphthalene (34%; RPD=59%), and phenanthrene (61%) were below laboratory and/or DoD QSM accuracy criteria. All other target compounds were within criteria. The associated solid LCS was within criteria. Acenaphthene, acenaphthylene, anthracene, chrysene, fluorene, 1-methylnaphthalene, 2-methylnaphthalene, naphthalene, and phenanthrene were non-detect for the spiked sample and qualified "UL" based upon the low recoveries. Samples 50SB06A (F51247-1), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this MS/MSD.

- Sample APSB08B (F51353-27) was used for the aqueous MS/MSD for PAH SIM analysis on 08/13/07. All criteria were met. No qualifiers were applied. Samples 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB08B (F51247-6), 50SB010B (F51247-10), and 50SB012B (F51247-14) apply to this MS/MSD.

X-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No project specific solid field duplicate was analyzed with this SDG; therefore, it was not evaluated.

XI-Quantitation Verification
The accuracy of analytical results was verified through the calculation of several parameters. Percent difference (%D) between the calculated and reported values must be ≤10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J."

Sample: 50SB06A (F51247-1), di-n-butyl phthalate

Conc. µg/kg = (Ax * Is * Vt * DF) / (Ais * RRF * Vi * Ws * D)

where: Conc. = Sample concentration in µg/kg
Ax = Area of characteristic ion for compound being measured.
Is = Amount of internal standard injected (ng).
Vt = Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10,000 uL.
Ais = Area of characteristic ion for the internal standard.
RRF = Average relative response factor for compound being measured (from ICAL)
Vi = Volume of extract injected (uL).
W(s) = Weight of sample extracted or diluted in grams.
D = Percent dry weight (100 - % moisture in sample)/100
DF = Dilution factor

Conc. µg/kg = (101016 * 40 * 1000 * 1) / (799753 * 1.457 * 1 * 30.3 * 0.8880) = 130 µg/kg
Reported Value = 129 µg/kg
% Difference = 0.8%
Values were within 10% difference

Sample: 50SB07A (F51247-3), chrysene

Conc. µg/kg = (Ax * Is * Vt * DF) / (Ais * RRF * Vi * Ws * D)

where: Conc. = Sample concentration in µg/kg
Ax = Area of characteristic ion for compound being measured.
Is = Amount of internal standard injected (ng).
Vt = Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10,000 uL.
Ais = Area of characteristic ion for the internal standard.
RRF = Average relative response factor for compound being measured (from ICAL)
Vi = Volume of extract injected (uL).
W(s) = Weight of sample extracted or diluted in grams.
D = Percent dry weight (100 - % moisture in sample)/100
DF = Dilution factor

Conc. µg/kg = (7702 * 4.0 * 1000 * 20) / (124514 * 1.560 * 1 * 30.2 * 0.8840) = 119 µg/kg
Reported Value = 119 µg/kg
% Difference = 0.0%
Values were within 10% difference

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Eric Malarek, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation - Volatiles
Accutest Laboratories, Inc., SDG F51247

DATE: November 30, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at Main Manufacturing Area at RFAAP for a RFI/CMS Nine Sites on July 23, 2007. The samples were analyzed for target compound list (TCL) volatile organic compounds (VOCs) using USEPA SW846 Method 5035/8260B for solid matrices. A total of twenty solid samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
50SB06A	F51247-1	50SB011A	F51247-11
50SB06B	F51247-2	50SB011B	F51247-12
50SB07A	F51247-3	50SB012A	F51247-13
50SB07B	F51247-4	50SB012B	F51247-14
50SB08A	F51247-5	50SB013A	F51247-15
50SB08B	F51247-6	50SB013B	F51247-16
50SB09A	F51247-7	50SB014A	F51247-17
50SB09B	F51247-8	50SB014B	F51247-18
50SB010A	F51247-9	50SB015A	F51247-19
50SB010B	F51247-10	50SB015B	F51247-20

Data were reviewed by Eric Malarek and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation

RFAAP VALIDATION REPORT
VOLATILES REVIEW
SDG F51247

I-Holding Times and Preservation
The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of analysis. Holding time criteria: For soil samples cooled @ 4°C±2°C; the maximum holding time is 14 days from sample collection to analysis.

- Temperature Review: The temperature blank was sent with each cooler and recorded by the laboratory upon receipt. For samples collected on 07/23/07, the coolers were received by the primary laboratory (Accutest) on 07/20/07 at 2.8°C, and 3.2°C. The herbicides were subcontracted to Accutest TX and were received the samples at 3.4°C. The dioxin subcontract laboratory (SGS Paradigm Analytical Laboratories, Inc.) received the samples at 1.2°C. Even though the receipt temperature was below criteria for some coolers, there were no impacts to the data quality. No qualifiers were applied based upon this outlier.

- Holding Time Review: For the solid samples collected 07/23/07, the VOCs were prepped and analyzed on 07/27/07, 07/30/07, and 07/31/07. All criteria were met. No qualifiers were applied.

II-Instrument Performance Check
The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed.

- The instrument performance check, bromofluorobenzene (BFB), met the ion abundance criteria. No qualification was applied.

III-Initial Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The RRF must be greater than 0.1 for chloromethane, 1,1-dichloroethane, and bromoform and greater than 0.3 for 1,1,2,2-tetrachloroethane and chlorobenzene. The minimum relative response factor (RRF) must be ≥0.05 for all other compounds. The DoD QSM specifies that the percent relative standard deviation (%RSD) must be ≤15% for each target compound and must be ≤30% for each calibration check compound. For compounds analyzed using linear regression or second order, correlation coefficients must be >0.995 and coefficients of determination >0.99. All detects are qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- For initial calibration performed on 07/16/07 on instrument MSVOA3, target compounds acetone (18.5%), methylene chloride (32.0%; grossly exceeding), ethylbenzene (15.1%), m,p-xylene (16.6%), and o-xylene (15.4%) were outside criteria. All other target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). Compounds acetone (r=0.9962), methylene chloride (r=1.0000), ethylbenzene (r=0.9985), m,p-xylene (r=0.9988), and o-xylene (r=0.9990) were quantified using linear or second order regression with correlation coefficients >0.995; therefore, no qualifiers were applied based upon these outliers. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07A (F51247-3), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), 50SB09B (F51247-8), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) were analyzed using this initial calibration. Confirmations for samples 50SB012B (F51247-14), 50SB013B (F51247-16), and 50SB015B (F51247-20) also apply to this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Continuing calibration establishes the 12-hour relative response factors on which the quantitations are based and checks satisfactory performance of the instrument on a day-to-day basis. The RRF must be greater than 0.1 for chloromethane, 1,1-dichloroethane, and bromoform and greater than 0.3 for 1,1,2,2-tetrachloroethane and chlorobenzene. The minimum relative response factor (RRF) must be ≥0.05 for all other compounds. The DoD QSM specifies that the percent difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within 20% for all target compounds. All detects are qualified as estimated "J" for where there were exceeding %Ds, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- For initial calibration verification performed on 07/16/07 @18:20 on instrument MSVOA3, bromomethane (36.1%) was outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). Bromomethane was non-detect for all samples; therefore, no qualifiers were applied based upon the high %D. No samples reported apply to this initial calibration verification. No qualifiers were applied based upon this outlier.

- For continuing calibration performed on 07/27/07 @11:02 on instrument MSVOA3, target compounds acetone (55.4%; grossly exceeding), 1,1,1-trichloroethane (25.9%) and carbon tetrachloride (30.4%) were outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). Acetone was qualified estimated "J" for detects and "UJ" for non-detects based upon the very high %Drift. 1,1,1-Trichloroethane and carbon tetrachloride were non-detect for all associated samples; therefore, no qualifiers were applied based upon these outliers. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), and 50SB09B (F51247-8) apply to this continuing calibration.

- For continuing calibration performed on 07/30/07 @12:07 on instrument MSVOA3, target compounds acetone (43.7%; grossly exceeding), 2-butanone (35.6%), trichloroethene (21.1%), and 2-hexanone (27.0%) were outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). Acetone was qualified estimated "J" for detects and "UJ" for non-detects based upon the very high %Drift. 2-Butanone, trichloroethene, and 2-hexanone were non-detect for all associated samples; therefore, no qualifiers were applied based upon these outliers. Samples 50SB07A (F51247-3), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this continuing calibration.

- For continuing calibration performed on 07/31/07 @11:12 on instrument MSVOA3, target compounds bromomethane (27.9%), chloroethane (25.4%), acetone (75.0%; grossly exceeding), and 2-butanone (22.9%) were outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). Acetone was qualified estimated "J" for detects and "UJ" for non-detects based upon the very high %Drift. Bromomethane, chloroethane, and 2-butanone were non-detect for all associated samples; therefore no qualifiers were applied based upon this outlier. Confirmations for samples 50SB012B (F51247-14), 50SB013B (F51247-16), and 50SB015B (F51247-20) apply to this continuing calibration.

V-Blank Analysis

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. A method blank analysis must be performed after the calibration standards and once every 12-hour time period beginning with the injection of BFB. No contaminants should be detected in any of the associated blanks > the MDL. The DoD QSM criteria specifies all concentrations should be less than one-half MRL (<MRL for common laboratory contaminants methylene chloride, acetone, and 2-butanone). Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants methylene chloride, acetone, and 2-butanone (MEK), or 5 times (5X) the maximum amount for other volatile target compounds. **Table 2** summarizes the blank contamination analysis. Action levels are based upon dilution factor of one and for solid matrices were converted to soil values (soil conversion factor = 1) as needed. Rinse blanks 072407R (F51275-1) and 072507R (F51300-31) apply to the surface soil "SS" and subsurface soil "SB" samples in this SDG. The trip blank TB072307 (F51247-21) applies to the solid samples collected 07/23/07.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/kg	Action Level µg/kg	B qualified samples
07/27/07	VH1663-MB	All target <½MRL	NA	NA	None
07/30/07	VH1664-MB	All target <½MRL	NA	NA	None
07/31/07	VH1665-MB	All target <½MRL	NA	NA	None
07/31/07	072407R	All target <½MRL	NA	NA	None
08/02/07	072507R	All target <½MRL	NA	NA	None
07/30/07	TB072307	All target <½MRL	NA	NA	None

NA = Not Applicable
MRL = Method Reporting Limit

VI-Laboratory Control Sample
Data for laboratory control samples (LCS) are evaluated to determine long-term accuracy of the analytical method on various matrices. Percent recoveries (%Rs) should be within the specified control limits. DoD LCS soil recovery limits are specified in Table D-5 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample VH1663-BS was used as the solid LCS for the VOC analysis on 07/27/07. All criteria were met. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), and 50SB09B (F51247-8) apply to this LCS.

- Sample VH1664-BS was used as the solid LCS for the VOC analysis on 07/30/07. All criteria were met. No qualifiers were applied. Samples 50SB07A (F51247-3), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this LCS.

- Sample VH1665-BS was used as the solid LCS for the VOC analysis on 07/31/07. All criteria were met. No qualifiers were applied. Confirmations for samples 50SB012B (F51247-14), 50SB013B (F51247-16), and 50SB015B (F51247-20) apply to this LCS.

VII-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. The DoD MS/MSD solid recovery limits follow the LCS criteria and are specified in Table D-5 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample F51244-2 was used for the solid MS/MSD analysis for analysis on 07/27/07. Since this sample is not a RFAAP site sample, it was not evaluated. No qualifiers were applied. Samples 50SB06A (F51247-1), 50SB06B (F51247-2), 50SB07B (F51247-4), 50SB08A (F51247-5), 50SB08B (F51247-6), 50SB09A (F51247-7), and 50SB09B (F51247-8) apply to this MS/MSD.

- Sample 50SB012A (F51247-13) was used for the solid MS/MSD analysis on 07/30/07. Acetone (48%, 47%), cis-1,3-dichloropropene (74%, 73%), trans-1,3-dichloropropene (83%), 2-hexanone (50%, 53%), 4-methyl-2-pentanone (54%, 56%), methyl ethyl ketone (47%, 48%), 1,1,2,2-tetrachloroethane (67%) were outside lab criteria and/or DoD QSM criteria for the MS/MSD sample. The associated LCS was within criteria for these compounds (See Section VI). The spiked sample was qualified bias low "UL" for non-detects for acetone, cis-1,3-dichloropropene, trans-1,3-dichloropropene, 2-hexanone, 4-methyl-2-pentanone, methyl ethyl ketone, and 1,1,2,2-tetrachloroethane based upon these outliers. All other percent recoveries were within criteria for all target compounds. Samples 50SB07A (F51247-3), 50SB010A (F51247-9), 50SB010B (F51247-10), 50SB011A (F51247-11), 50SB011B (F51247-12), 50SB012A (F51247-13), 50SB012B (F51247-14), 50SB013A (F51247-15), 50SB013B (F51247-16), 50SB014A (F51247-17), 50SB014B (F51247-18), 50SB015A (F51247-19), and 50SB015B (F51247-20) apply to this MS/MSD.

- Sample 43SB10C (F51300-29) was used for the solid MS/MSD analysis on 07/31/07. Acetone (53%, 55%), carbon tetrachloride (139%, 141%), 2-hexanone (62%), 4-methyl-2-pentanone (61%), methyl bromide (156%, 155%), methyl ethyl ketone (54%, 57%), 1,1,1-trichloroethane (135%), and toluene (133%) were outside lab criteria and/or DoD QSM criteria for the MS/MSD sample. The associated LCS was within criteria for these compounds (See Section VI). The spiked sample was qualified bias low "UL" for non-detects for acetone, 2-hexanone, 4-methyl-2-pentanone, and methyl ethyl ketone based upon these outliers. No qualifiers were applied for carbon tetrachloride, methyl bromide, 1,1,1-trichloroethane, and toluene based upon the high recoveries (spiked sample was non-detect for these compounds). All other percent recoveries were within criteria for all target compounds. Confirmations for samples 50SB012B (F51247-14), 50SB013B (F51247-16), and 50SB015B (F51247-20) apply to this MS/MSD.

VIII-System Monitoring Compounds (Surrogates)

Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Recoveries for system monitoring compounds in volatile samples and blanks must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Solid Criteria:
Dibromofluoromethane (80-121%) (DoD QSM = None Listed)
Toluene-d8 (71-130%) (DoD QSM = 85-115%)
4-Bromofluorobenzene (59-148%) (DoD QSM = 85-120%)
1,2-Dichloroethane-d4 (77-123%) (DoD QSM = None Listed)

- For sample 50SB06A (F51247-1), 4-bromofluorobenzene (122%) was outside DoD QSM criteria and within lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier.

- For sample 50SB07A (F51247-3), 4-bromofluorobenzene (123%) was outside DoD QSM criteria and within lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier.

- For sample 50SB010A (F51247-9), 4-bromofluorobenzene (121%) was outside DoD QSM criteria and within lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier.

- For sample 50SB012B (F51247-14), dibromofluoromethane (124%) and 4-bromofluorobenzene (144%) were outside DoD QSM criteria and within lab criteria. All detects were qualified estimated high "K" and non-detects no qualifier based upon these outliers. The sample was rerun for confirmation with 107% (within criteria) recovery.

- For sample 50SB013B (F51247-16), 4-bromofluorobenzene (146%) was outside DoD QSM criteria and within lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier. The sample was rerun for confirmation with 130% recovery.

- For sample 50SB015B (F51247-20), dibromofluoromethane (130%) was outside DoD QSM criteria and within lab criteria. Since all other surrogates were within criteria, no qualifiers were applied based upon this outlier. The sample was rerun for confirmation with 123% recovery.

- For all other samples, all criteria were met. No qualifiers were applied.

IX-Internal Standards (IS)
Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Specific criteria include: area counts (-50% to +100%) of the associated calibration standard, and retention time (± 30 seconds) from that of the associated calibration standard.

- For sample 50SB08A (F51247-5), internal standard 4 tert-butyl-alcohol-d10 was below criteria limits. No target analytes were quantified using this internal standard; therefore, no qualifiers were applied based upon this outlier. All other internal standards were within criteria.

- For sample 50SB08B (F51247-6), internal standard 4 tert-butyl-alcohol-d10 was below criteria limits. No target analytes were quantified using this internal standard; therefore, no qualifiers were applied based upon this outlier. All other internal standards were within criteria.

- For sample 50SB09B (F51247-8), internal standard 4 tert-butyl-alcohol-d10 was below criteria limits. No target analytes were quantified using this internal standard; therefore, no qualifiers were applied based upon this outlier. All other internal standards were within criteria.

- For sample 50SB010A (F51247-9), internal standard 4 tert-butyl-alcohol-d10 was below criteria limits. No target analytes were quantified using this internal standard; therefore, no qualifiers were applied based upon this outlier. All other internal standards were within criteria.

- For sample 50SB012B (F51247-14), internal standard 3 1,4-dichlorobenzene-d4 was below criteria limits. No target analytes were quantified using 1,4-dichlorobenzene-d4; therefore, no qualifiers were applied based upon this outlier. All other internal standards were within criteria. The sample was rerun for confirmation.

- For confirmation run of sample 50SB012B (F51247-14), internal standard 3 1,4-dichlorobenzene-d4 and internal standard 4 tert-butyl-alcohol-d10 were below criteria limits. No target analytes were quantified using 1,4-dichlorobenzene-d4 or tert-butyl-alcohol-d10; therefore, no qualifiers were applied based upon these outliers. All other internal standards were within criteria. The sample was rerun for confirmation.

- For sample 50SB013B (F51247-16), internal standard 3 1,4-dichlorobenzene-d4 was below criteria limits. No target analytes were quantified using 1,4-dichlorobenzene-d4; therefore, no qualifiers were applied based upon this outlier. All other internal standards were within criteria. The sample was rerun for confirmation.

- For confirmation run of sample 50SB013B (F51247-16), internal standard 3 1,4-dichlorobenzene-d4 was below criteria limits. No target analytes were quantified using 1,4-dichlorobenzene-d4; therefore, no qualifiers were applied based upon this outlier. All other internal standards were within criteria. The sample was rerun for confirmation.

- For all other samples, all criteria were met. No qualifiers were applied.

X-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No project specific solid field duplicate was analyzed with this SDG; therefore, it was not evaluated.

XI-Quantitation Verification
The accuracy of analytical results is verified through the calculation of several parameters. The percent difference (%D) between the calculated and the reported values should be within 10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J."

Sample: 50SB012AMS (F51247-13MS), methyl ethyl ketone

Conc. (µg/kg) = {(Ax)*(Is)*(DF)*(Vp)} / {(Ais)*(RRF)*(Ws)*Fs)}
where:
Ax is the compound area
Is is the corresponding internal standard concentration (ng/mL)
DF is the dilution factor
Vp is the volume purged (mL)
Ais is the corresponding internal standard area
RRF is the relative response factor
Ws is the weight of the sample (g)
Fs is the fraction solids for the sample

Conc. µg/kg = (583457 * 50 ng/mL * 1 * 5mL) / (880802 * 0.284 * 5.06g * 0.854) =
= 135 µg/kg

Reported Conc. = 135 µg/kg
%D = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Explosives, PETN, & Nitroglycerin
Accutest Laboratories, Inc., SDG F51275

DATE: December 12, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on July 24, 2007. The samples were analyzed for explosives using USEPA SW846 Method 8330A, and nitroglycerin & PETN using USEPA SW-846 Method 8332A. A total of one aqueous and three soil samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
072407R	F51275-1	59SB03B	F51275-3
59SB03A	F51275-2	59SB03C	F51275-4

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Blank Analysis
	X	Initial Calibration
	X	Continuing Calibration
	X	System Monitoring Compounds
	X	Laboratory Control Sample
	X	Matrix Spike/Spike Duplicate
	X	Field Duplicate
	X	Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable.

Richard M. Cracken

Richard McCracken, Chemist

RFAAP VALIDATION REPORT
EXPLOSIVES REVIEW
SDG F51275

I-Holding Times and Preservation

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Solid samples must be cooled @4°C ± 2°C, with a maximum holding time of 14 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis. Aqueous samples must be cooled @4°C ± 2°C, with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 7/24/07 were sent in two coolers, and were received by the laboratory on 7/25/07 at 2.6 °C & 3.4 °C. No qualifiers were applied.

- Holding Time Review: The samples were collected on 7/24/07, extracted on 7/31/07 & 8/1/07, analyzed for PETN and nitroglycerine on 8/1/07 & 8/3/07, and analyzed for all other explosives on 8/1/07 & 8/3/07. All criteria were met. No qualifiers were applied.

II-Blank Analysis

The purpose of laboratory or field blank analyses is to determine the existence and magnitude of contamination problems resulting from laboratory or field activities. One method blank per analytical batch must be run on each instrument used to analyze samples. No contaminants should be present in the blanks. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤5 times (5x) the maximum amount for explosive target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
8/1/07	OP21682-MB	All target explosives <½MRL	NA	NA	None
8/1/07	OP21682-MB	PETN & NG <½MRL	NA	NA	None
8/3/07	OP21693-MB	All target explosives <½MRL	NA	NA	None
8/3/07	OP21693-MB	PETN & NG <½MRL	NA	NA	None
8/1/07	072407R	All target explosives <½MRL	NA	NA	None
8/1/07	072407R	PETN & NG <½MRL	NA	NA	None

072407R is a rinsate blank
MRL = Method Reporting Limit
NA = Not Applicable

III-Initial Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. The initial 5-point calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run. The DoD QSM specifies that the correlation coefficient (r^2) must be ≥0.990 and/or the percent relative standard deviation (%RSD) must be ≤20%. All detects were qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects were qualified as estimated "UJ" for where there were grossly exceeding recoveries. Grossly exceeding is defined as twice the established criteria limits.

- During the explosives initial calibration performed on 10/18/06 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

- During the PETN and nitroglycerine initial calibration performed on 03/15/07 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. Continuing calibration standards are analyzed after every 10 injections, and at the end of the analysis sequence. The DoD QSM specifies that the percent difference (%D) from initial calibration should be no greater than ±20%. All detects were qualified as estimated "J" for where there were exceeding %Ds, and all non-detects were qualified as estimated "UJ" for where there were grossly exceeding recoveries. Grossly exceeding is defined as twice the established criteria limits.

- During the explosives initial calibration verification performed on 10/18/06 @1739 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples were analyzed after this initial calibration verification.

- During the explosives initial calibration verification performed on 10/19/06 @1344 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples were analyzed after this initial calibration verification.

- During the explosives continuing calibration verification performed on 8/1/07 @1220 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Sample 072407R was analyzed following this continuing calibration.

- During the explosives continuing calibration verification performed on 8/1/07 @1705 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Sample 072407R was analyzed before this continuing calibration.

- During the explosives continuing calibration verification performed on 8/2/07 @2239 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. The solid matrix method blank, LCS, MS, & MSD were analyzed after this continuing calibration.

- During the explosives continuing calibration verification performed on 8/3/07 @0411 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. The solid matrix method blank, LCS, MS, & MSD were analyzed before this continuing calibration.

- During the explosives continuing calibration verification performed on 8/3/07 @0941 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed after this continuing calibration.

- During the explosives continuing calibration verification performed on 8/3/07 @1537 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed before this continuing calibration.

- During the PETN and nitroglycerin initial calibration verification performed on 3/15/07 @1235 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples were analyzed in conjunction with this initial calibration verification.

- During the PETN and nitroglycerin continuing calibration performed on 8/1/07 @1027 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Sample 072407R was analyzed after this continuing calibration.

- During the PETN and nitroglycerin continuing calibration performed on 8/1/07 @1136 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Sample 072407R was analyzed before this continuing calibration.

- During the PETN and nitroglycerin continuing calibration performed on 8/3/07 @0924 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. The solid matrix method blank and LCS were analyzed after this continuing calibration.

- During the PETN and nitroglycerin continuing calibration performed on 8/3/07 @1059 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. The solid matrix method blank and LCS were analyzed before this continuing calibration.

- During the PETN and nitroglycerin continuing calibration performed on 8/3/07 @1241 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed after this continuing calibration.

- During the PETN and nitroglycerin continuing calibration performed on 8/3/07 @1333 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed before this continuing calibration.

V-System Monitoring Compound (Surrogates)
Laboratory performance on individual samples is established by means of spiking activities. The percent recovery (%R) for all samples and blanks must be within the laboratory control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Solid Criteria: 3,4-dinitrotoluene (72-145%)

Aqueous Criteria: 3,4-dinitrotoluene (70-136%)

- All criteria were met for explosives, PETN, and nitroglycerin. No qualifiers were applied.

VI-Laboratory Control Sample
Laboratory control samples (LCS) are used to monitor long-term accuracy of the analytical method. The analysis is performed at a frequency of 1 per analytical batch. The percent recoveries (%Rs) must be within the laboratory control limits. DoD QSM solid matrix LCS recovery limits are specified in Table D-13 of the DoD QSM (DoD, 2006), while the aqueous LCS recovery limits are specified in Table D-12 of the DoD QSM. If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP21682-BS was used as the aqueous LCS for explosives, PETN, and nitroglycerin analysis. All compounds met recovery criteria. Sample 072407R was analyzed in conjunction with this LCS.

- Sample OP21693-BS was used as the solid LCS for explosives, PETN, and nitroglycerin analysis. All compounds met recovery criteria. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this LCS.

VII-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the laboratory control limits. DoD MS/MSD recovery limits follow the LCS criteria specified in Table D-12 (aqueous) and D-13 (solid matrix) of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample 072407R was used for the aqueous MS/MSD analysis. All compounds met criteria. Sample 072407R was analyzed in conjunction with this MS/MSD.

- Sample F51154-18 was used for the solid MS/MSD analysis. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this MS/MSD.

VIII-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No field duplicates were included in this data package.

IX-Quantitation Verification
The accuracy of analytical results was verified through the calculation of several parameters. The calculation was based calibration factors. The absolute percent difference (%D) between the calculated and the reported value must be within 10% difference. All values >MDL and <MRL or <3*MDL (whichever was greater) were qualified as estimated "J".

- The %D between the primary and secondary columns was within criteria for all detected compounds.

Sample: OP21693-BS, HMX

Conc. µg/kg = (Ax * Vt * DF) / (CF * Vi * Ws * Ps * 1000)

where: Ax = Area response for the compound being measured
Vt = Total volume of extract, taking into account dilutions (uL)
DF = Dilution factor
CF = Calibration Factor from initial calibration (area/pg)
Vi = Volume of extract injected (uL)
Ws = weight of sample (g)
Ps = percent solids/100

Conc. µg/kg = (1654265 * 20000 * 1) / (2764 * 1 * 2 * 1 * 1000)
= 5980 ug/kg

Reported Value = 5980 µg/kg
% Difference = 0.0%
Values were within 10% difference

Sample: OP21693-BS2, nitroglycerin

Conc. µg/kg = (Ax * Vt * DF) / (CF * Vi * Ws * Ps * 1000)

where:
- Ax = Area response for the compound being measured
- Vt = Total volume of extract, taking into account dilutions (uL)
- DF = Dilution factor
- CF = Calibration Factor from initial calibration (area/pg)
- Vi = Volume of extract injected (uL)
- Ws = weight of sample (g)
- Ps = percent solids/100

Conc. µg/kg = (3475817 * 20000 * 1) / (1228 * 1 * 2.0 * 1 * 1000)
= 28300 ug/kg

Reported Value = 28300 µg/kg
% Difference = 0.0%
Values were within 10% difference

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

Shaw® Shaw Environmental, Inc.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Dioxin Furans
SGS Paradigm Analytical Laboratories, Inc. Project G383-587
(Accutest SDG F51275)

DATE: December 18, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on July 24, 2007. The samples were analyzed for Dioxin and Furan compounds using USEPA SW-846 Method 8290 High Resolution Gas Chromatography/High Resolution Mass Spectroscopy (HRGC/HRMS). A total of one aqueous and three soil samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	**Field Sample ID**	Lab Sample ID
072407R	F51275-1	59SB03B	F51275-3
59SB03A	F51275-2	59SB03C	F51275-4

Data were reviewed and validated using a combination of project QAPP, *DOD Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *USEPA Region III Dioxin/Furan Data Validation Guidance* (March, 1999). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
X		Blank Analysis
	X	Instrument Performance Check
	X	Initial Calibration
	X	Continuing Calibration
	X	Internal Standards (IS) Recovery Standard Solutions
	X	Cleanup Standards
	X	Laboratory Control Standard or Ongoing Precision Result (OPR)
	X	Matrix Spike and Spike Duplicate
	X	Field Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Richard M. Cracken

Richard McCracken, Chemist

RFAAP VALIDATION REPORT
DIOXIN FURAN REVIEW
SDG G383-587
(Accutest SDG F51275)

I-Holding Times and Preservation

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Dioxin and furan samples must be shipped @4°C ± 2°C, with a maximum holding time of 30 days from sample collection to preparative extraction and 45 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 7/24/07 were sent in two coolers, and were received by the laboratory on 7/25/07 at 2.6 °C & 3.4 °C. No qualifiers were applied. Accutest shipped the dioxin aliquots to SGS Paradigm Analytical Laboratories on 7/27/07, and they were received by SGS Paradigm on 7/31/07 at 4.6°C. No qualifiers were applied.

- Holding Time Review: The samples were collected on 7/24/07, extracted on 8/1/07 & 8/7/07, and analyzed on 8/3/07 & 8/9/07. All criteria were met. No qualifiers were applied.

II-Blank Analysis

The purpose of laboratory (or field) blank analyses is to determine the existence and magnitude of contamination problems resulting from field and laboratory activities. No contamination should be found in any of the blanks >EDL (estimated detection limit). The DoD QSM criteria specifies all concentrations should be less than ½ MRL (<MRL for common laboratory contaminants OCDD and OCDF) and <2EDL for the calibration blanks. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants OCDD or OCDF, or 5 times (5X) the maximum amount for other target compounds. **Table 2** summarizes the blank contamination.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. pg/g	Action Level pg/g	B qualified samples
8/2/07	LMB14393	All	ND	NA	None
8/9/07	LMB14402	1,2,3,4,6,7,8-HpCDD	0.446	2.23	None
8/9/07	LMB14402	OCDD	2.84	28.4	None
8/9/07	LMB14402	1,2,3,4,7,8-HxCDF	0.258	1.29	F51275-2, -4
8/9/07	LMB14402	1,2,3,6,7,8-HxCDF	0.126	0.63	None
8/9/07	LMB14402	1,2,3,4,6,7,8-HpCDF	1.23	6.15	F51275-4
8/9/07	LMB14402	OCDF	1.95	19.5	F51275-4
8/3/07	072407R	All	ND	NA	None

LMB14393 is an aqueous method blank, for sample F51275-1.
LMB14402 is a solid matrix method blank, for samples F51275-2, -3, & -4.
072407R is a rinsate blank.
J = Estimated value <MRL and >EDL.

III-Instrument Performance Check

Instrument must be tuned with perfluorokerosene (PFK) to achieve a static resolving power of at least 10,000 (10% valley) and lock-mass ion between lowest and highest masses for each descriptor and level of reference compound ≤10%. Documentation of the mass spectrometer resolving power is accomplished by recording the peak profile of the high-mass reference signal (typically m/z 330.9792) obtained during a peak examination by using the low-mass PFK ion at m/z 292.9825 or lower in mass as reference. At the beginning of the each 12-hour period, the chromatographic resolution is verified in the same fashion as in the initial calibration through the analysis of HRCC solution on the DB-5 (or equivalent) column or through the analysis of the column performance solution on the SP-2331 or SP-225 (or equivalent) column. A 25% valley must be achieved between the close eluters.

- All PFK forms were verified and found to be in compliance with method specification. No qualifiers were applied.

IV-Initial Calibration
Once the window defining mix has been analyzed and the descriptor switching times have been verified, the five point calibration solutions can be analyzed prior to sample analysis. Per method and DoD QSM, the initial calibration criteria are as follows:

  - The percent relative standard deviations for the mean response factors RRF(n) from the 17 unlabeled standards must not exceed ±20%, and those for the labeled reference compounds must not exceed ±30%;
  - The signal to noise ratio ≥10% for all target ions;
  - Ion abundance ratios must be within the specified control limits in Table 8 (SW846 Method 8290).

- During initial calibration performed on 07/10/07 using instrument HRMS1, all compounds met criteria. No qualifiers were applied. Sample F51275-1 was analyzed in conjunction with this initial calibration.

- During initial calibration performed on 11/2/06 using instrument HRMS3, all compounds met criteria. No qualifiers were applied. Samples F51275-2, F51275-3, and F51275-4 were analyzed in conjunction with this initial calibration.

V-Continuing Calibration
The continuing calibration consists of two parts: evaluation of the mass resolution and retention time check. Per method and DoD QSM, the following stipulates the continuing calibration criteria.

  - The signal signal-to-noise ratio (S/N) must be at least 10:1 for each selected ion current profile (SICP) and for each GC signal representing the elution of a target analyte or labeled standard for each analyte.
  - The relative response factor of each analyte for the unlabeled standard must be within ±20% of the average RF obtained from the initial calibration, and the RRF of each labeled standard must be within ±30% of the average RRF established during initial calibration. This is expressed in term of percent difference %D.
  - Ion abundance ratios must be within the specified control limits in Table 8 (SW846 Method 8290).

- During the continuing calibration performed on 8/2/07 @1603 on instrument HRMS1, all criteria were met. No qualifiers were applied. Sample F51275-1 was analyzed following this continuing calibration.

- During the continuing calibration performed on 8/3/07 @0324 on instrument HRMS1, all criteria were met. No qualifiers were applied. Sample F51275-1 was analyzed before this continuing calibration.

- During the continuing calibration performed on 8/9/07 @1323 on instrument HRMS3, all criteria were met. No qualifiers were applied. Samples F51275-2, F51275-3, and F51275-4 were analyzed after this continuing calibration.

- During the continuing calibration performed on 8/9/07 @2234 on instrument HRMS3, 13C-1,2,3,4-TCDD (37.2%) and 13C-1,2,3,7,8,9-HxCDD (36.4%) had high %D. These labeled standards are injection standards only, the standards used for quantitation met criteria, so no data qualifiers were applied. All other standards met criteria. Samples F51275-2, F51275-3, and F51275-4 were analyzed after this continuing calibration.

VI-Internal Standards (IS) Recovery Standard Solutions
Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Specific criteria include: Recoveries of the isotopically-labeled recovery standards to fall within the 40 to 135 percent range for the tetra- through octachlorinated congeners, or as stated in the data package (DoD QSM limits 40-135%).

- All field samples met criteria. No qualifiers were applied.

VII-Cleanup Standards
Cleanup standards are added to every sample, blank, quality control sample, and calibration solution. This compound is added to the samples after extraction but prior to cleanup and is used to verify the percent recovery obtained using the isotope dilution technique. The control limits are 40 to 135 percent (DoD QSM limits 40-135%).

- All field samples met criteria. No qualifiers were applied.

VIII-Laboratory Control Standard (LCS) or Ongoing Precision Result (OPR)
LCSs are used to monitor laboratory accuracy and precision by calculating the percent recoveries of the spiked compounds. Per DOD QSM and method criteria, acceptable performance is determined by:

1. Recoveries of the isotopically-labeled extraction standards to fall within 40-135% control limits for the tetra- through octachlorinated congeners, or as stated in the data package;

2. Recoveries (accuracy) of the unlabeled compounds should be within $\pm$35% when spiked at the method quantitation limit and within $\pm$30% when spiked above 20 times the method quantitation limit, or as stated in the data package;

3. When duplicate OPR are required, the relative percent difference (RPD) of the unlabeled analytes concentrations should be within 30% when spiked at the method quantitation limit and within $\pm$20% when spiked above 20 times the method quantitation limit.

- Sample OPR14402 was used as the solid LCS/LCSD during the 8/9/07 analytical run. All criteria were met. No qualifiers were applied. Samples F51275-2, F51275-3, and F51275-4 were analyzed in conjunction with this LCS.

- Sample OPR14393 was used as the aqueous LCS/LCSD during the 8/2/07 analytical run. All criteria were met. No qualifiers were applied. Sample F51275-1 was were analyzed in conjunction with this LCS.

IX-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. Per DoD QSM, MS/MSD recoveries must be within in-house laboratory limits (75-125%) and RPD $\leq$20%.

- MS/MSD analysis was not performed on an RFAAP sample. No data qualification was required.

X-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No field duplicates were included in this data package.

XI-Quantitation Verification
The accuracy of analytical results was verified through the calculation of at least one the several parameters such as the %D, %RSD, % recovery, and/or compound concentration. Values were found to be within 10%. Any value reported by the laboratory as estimated "A" based on an analyte to internal standard ratio below the calibration curve was qualified as estimated "J". The signal signal-to-noise ratio (S/N) must be greater than 2.5 for each selected ion current profile (SICP) and for each GC signal representing the elution of a target analyte or labeled standard. Any detected value with ether interference (I-lab flag) was qualified as estimated "J". When the ion ratio failed the 25% criteria (*-lab flag), the estimated maximum possible concentration (EMPC) was reported and flagged estimated "J". If of quantitation interference was present (Q-lab flag), the date was flagged estimated "J" for detects and "UJ" for non-detects.

- The 1,2,3,7,8-PeCDD, 1,2,3,4,7,8-HxCDD, 1,2,3,6,7,8-HxCDD, 1,2,3,7,8,9-HxCDD, 2,3,7,8-TCDF, 1,2,3,7,8-PeCDF, 2,3,4,7,8-PeCDF, 1,2,3,4,7,8-HxCDF, 1,2,3,6,7,8-HxCDF, 2,3,4,6,7,8-HxCDF, and 1,2,3,4,7,8,9-HpCDF results in F51275-2 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The ion abundance ratios for 1,2,3,7,8-PeCDF and 1,2,3,6,7,8-HxCDF did not meet criteria and have been reported as an Estimated Maximum Possible Concentration (EPMC). Since the results have already been qualified "J", no further qualification is required.

- The 2,3,7,8-TCDF and 1,2,3,4,6,7,8-HpCDF results in F51275-3 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The ion abundance ratio for 1,2,3,4,6,7,8-HpCDF did not meet criteria and has been reported as an Estimated Maximum Possible Concentration (EPMC). Since the result has already been qualified "J", no further qualification is required.

- The 1,2,3,7,8-PeCDD, 1,2,3,4,7,8-HxCDD, 1,2,3,6,7,8-HxCDD, 1,2,3,7,8,9-HxCDD, 2,3,4,7,8-PeCDF, 1,2,3,4,7,8-HxCDF, 1,2,3,6,7,8-HxCDF, 2,3,4,6,7,8-HxCDF, 1,2,3,4,6,7,8-HpCDF, and OCDF results in F51275-4 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The ion abundance ratios for 1,2,3,7,8-PeCDD, 1,2,3,4,7,8-HxCDD, 2,3,4,7,8-PeCDF, 1,2,3,6,7,8-HxCDF, and 2,3,4,6,7,8-HxCDF did not meet criteria and have been reported as an Estimated Maximum Possible Concentration (EPMC). Since the results have already been qualified "J", no further qualification is required.

Sample: 49MW01 (F51275-1), OCDD

A(x) = sum of the integrated ion abundances of the quantitation ions for the unlabeled ions;
A(is) = sum of the integrated ion abundances of the quantitation ions for the labeled ions;
Q(is) = quantity, in ng/ul, of the internal standard added to the sample before extraction;
Avg. RRF = calculated mean relative response factor for the unlabeled analyte.
Ws = weight of sample (g)
Ps = percent solids/100

$$\text{Conc. (ng/L)} = \frac{(A(x)) * Q(is) * 1000}{A(is) * \text{Avg. RRF} * Ws * Ps} = \frac{(2910000) * 4.0 * 1000}{(704000) * 1.12564 * 10.56 * 0.797} = 1750 \text{ pg/g}$$

Reported Value = 1750 pg/g
% Difference = 0.0%
Values were within 10% difference

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ EDL and <MRL or <3*EDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥EDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ EDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I RFAAP Project Manager

FROM: Richard McCracken, Shaw E&I RFAAP Project Chemist

SUBJECT: Radford Army Ammunition Plant (RFAAP) Data Validation – Herbicides
Accutest Laboratories, Inc., SDG F51275

DATE: December 17, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on July 24, 2007. The samples were analyzed for chlorinated herbicides using USEPA SW846 Method 8151A. A total of one aqueous and three soil samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
072407R	F51275-1	59SB03B	F51275-3
59SB03A	F51275-2	59SB03C	F51275-4

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times
X		Initial Calibration
	X	Continuing Calibration
	X	Blank Analysis
	X	System Monitoring Compounds
	X	Laboratory Control Sample
X		Matrix Spike/Spike Duplicate
	X	Field Duplicate
	X	Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Richard McCracken, Chemist

RFAAP VALIDATION REPORT
CHLORINATED HERBICIDES REVIEW
SDG F51275

I-Holding Times

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Solid samples must be cooled @4°C ± 2°C, with a maximum holding time of 14 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis. Aqueous samples must be cooled @4°C ± 2°C, with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 7/24/07 were sent in two coolers, and were received by the laboratory on 7/25/07 at 2.6 °C & 3.4 °C. No qualifiers were applied.

- Holding Time Review: The samples were collected on 7/24/07, extracted on 7/31/07, and analyzed on 8/2/07 & 8/3/07. All criteria were met. No qualifiers were applied.

II-Initial Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The DoD QSM specifies that the percent relative standard deviation (%RSD) for a 5-point standard calibration should be ≤20% for each target compound.

- No initial calibration data was provided for MCPP or MCPA. During discussions with the laboratory, they indicated that they perform a one-point calibration each day that analysis for MCPP or MCPA is conducted. A five-point initial calibration was not performed, therefore all data for these two compounds has been qualified "J/UJ".

- During the initial calibration performed on 8/1/07 on instrument GC-GG, pentachlorophenol (20.65%) and 2,4,5-TP (Silvex) (20.32%) had %RSD > 20% on signal #1 - the results for these two compounds have been qualified "J/UJ". The other target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. All samples were analyzed following this initial calibration.

III-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Continuing calibration establishes the response factors on which the quantitations are based and checks satisfactory performance of the instrument on a day-to-day basis. The DoD QSM specifies that the percent difference (%D) between the initial calibration CF and the continuing calibration CF must be ≤20%.

- A one-point daily calibration from 8/2/07 @1149 and 8/3/07 @1729 was provided for MCPP and MCPA, indicating that the lab is able to detect and quantitate both compounds. %D data was not supplied since a five-point initial calibration was not performed. All MCPP and MCPA data has already been qualified (see initial calibration), no additional qualification is required.

- During continuing calibration performed on 8/2/07 @1244 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed after this continuing calibration.

- During continuing calibration performed on 8/2/07 @2009 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed before this continuing calibration.

- During continuing calibration performed on 8/3/07 @0134 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. The MS & MSD were analyzed after this continuing calibration.

- During continuing calibration performed on 8/3/07 @0350 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. The MS & MSD were analyzed before this continuing calibration.

- During continuing calibration performed on 8/3/07 @1756 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. Sample 072407R plus the aqueous MS & MSD were analyzed after this continuing calibration.

- During continuing calibration performed on 8/3/07 @2322 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. Sample 072407R plus the aqueous MS & MSD were analyzed before this continuing calibration.

IV-Blank Analysis

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field or laboratory activities. No contaminants should be detected in any of the associated blanks. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are qualified "B" if the concentration of the analyte is ≤ five times (5x) the absolute maximum blank concentration. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/L or ug/kg	Action Level µg/L	B qualified samples
8/2/07	OP7785-MB	All target compounds <½MRL	NA	NA	None
8/3/07	OP7790-MB	All target compounds <½MRL	NA	NA	None
8/3/07	072407R	All target compounds <½MRL	NA	NA	None

072407R is a rinsate blank.
NA = Not applicable. MRL = Method reporting limit.

V-System Monitoring Compounds (Surrogates)

Laboratory performance on individual samples is established by means of spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. Spike recoveries must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Control Limit: 2,4-DCAA (34-179%)

- All samples met recovery criteria.

VI-Laboratory Control Samples
Data for laboratory control samples (LCS) are generated to determine long-term precision and accuracy of the analytical method. Percent recoveries must be within the specified control limits. DoD LCS recovery limits are specified in Tables D-8 (aqueous) and D-9 (solid matrix) of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP7785-BS was used as the solid matrix LCS during the 8/2/07 run. All herbicides were within criteria, no data qualifiers were applied. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this LCS.

- Sample OP7790-BS was used as the aqueous LCS during the 8/3/07 run. All herbicides were within criteria, no data qualifiers were applied. Sample 072407R was analyzed in conjunction with this LCS.

VII-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD MS/MSD recovery limits follow the LCS criteria specified in Tables D-8 (aqueous) and D-9 (solid matrix) of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Solid matrix MS/MSD analysis was performed on F51300-25 (an RFAAP sample analyzed as part of Accutest job number 51300) . Dichloroprop (65%) had a low recovery in the MS – the dichloroprop results in associated samples have been qualified "J/UJ". 2,4,5-TP (Silvex), 2,4,5-T, and dalapon had high RPDs – no data qualification is performed on RPD data alone. All other herbicides met recovery and RPD criteria. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this MS/MSD.

- Aqueous MS/MSD analysis was performed on 072407R. Dinoseb (13%, 14%) had a low recovery in the MS & MSD, the dinoseb results in associated samples have been qualified "J/UJ". All other herbicides met recovery and RPD criteria. Sample 072407R was analyzed in conjunction with this MS/MSD.

VIII-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were qualified because of blank contamination (B-qualified) or were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No field duplicates were included in this data package.

IX-Quantitation Verification

The accuracy of analytical results is verified through the calculation of several parameters. Percent difference (%D) between the calculated value and the reported value must be within 10%. All positive values must have less than or equal to 40% %D between the primary and secondary columns. Any sample value >MDL and <MRL is qualified as estimated, "J." All criteria were met. No qualifiers were applied.

- The %D between the primary and secondary columns was within criteria for all detected chlorinated herbicides.

Sample: OP7785-BS, 2,4,5-TP (Silvex)

Conc. µg/kg = (Ax * Vt * DF) / (CF * Vi * Ws * Ps * 1000)

where:
- Ax = Area response for the compound being measured
- Vt = Total volume of extract, taking into account dilutions (uL)
- DF = Dilution factor
- CF = Calibration Factor from initial calibration (area/pg)
- Vi = Volume of extract injected (uL)
- Ws = weight of sample (g)
- Ps = percent solids/100

Conc. µg/kg = (1639054 * 10000 * 1) / (48130 * 1 * 30.11 * 1 * 1000)
= 11.3 ug/kg

Reported Conc. = 11.3 µg/kg
%D = 0.0%
Values were within 10% difference

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

A (Dioxins) = MDL is based upon the signal-to-noise measurement.

B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics and Dioxins) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

D (Organics) = Indicates sample was analyzed at a dilution.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

E (Dioxins) = Reported value is estimated because of the presence of ether interferences.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/F ions is outside accepted ranges. The detected PCDD/F is reported as an estimated maximum possible concentration (EMPC).

I (Dioxins) = Reported value is estimated because of the incorrect isotope rations were obtained.

J (All) = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, (2) estimating a concentration <MRL and ≥ MDL, or estimating a concentration below the calibration range.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

U (All) = ND = BQL = Not detected. The associated number indicates the compound reporting limit for the sample.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – TAL Metals
Accutest Laboratories, Inc., SDG F51275

DATE: December 17, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on July 24, 2007. The samples were analyzed for target analyte list (TAL) metals using USEPA SW-846 3010A/6010B (aqueous) and 3050B/6010B (solid matrix) for ICP metals; and SW-846 7470A (aqueous) and 7471A (solid matrix) for mercury. A total of one aqueous and three soil samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
072407R	F51275-1	59SB03B	F51275-3
59SB03A	F51275-2	59SB03C	F51275-4

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Inorganic Data Review* (April, 1993). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times
X		Initial and Continuing Calibration
	X	Blank Analysis
	X	ICP Interference Check Sample (ICS)
	X	Laboratory Control Sample (LCS)
X		Laboratory Sample Duplicate
X		Matrix Spike and Spike Duplicate
X		ICP Serial Dilution
	X	Field Sample Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Richard McCracken, Chemist

Date

RFAAP VALIDATION REPORT
METALS REVIEW
SDG F51275

I-Holding Times

The primary objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample analysis. Holding time criteria: Solid samples must be cooled @4°C±2°C with a maximum holding time of 180 days for ICP metals and 28 days for mercury. Aqueous samples must be preserved to pH<2 with HNO_3 and cooled @4°C±2°C, with a maximum holding time of 180 days for ICP metals and 28 days for mercury.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 7/24/07 were sent in two coolers, and were received by the laboratory on 7/25/07 at 2.6 °C & 3.4 °C. No qualifiers were applied.

- Holding Time Review: The samples were collected 7/24/07 for metals analysis, digested for mercury on 7/26/07 and 7/28/07, analyzed for mercury on 7/26/07 and 7/28/07, digested for ICP metals on 7/30/07, and analyzed for ICP metals on 7/30/07 & 7/31/07. All criteria were met. No qualifiers were applied.

II-Initial and Continuing Calibration

Requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable quantitative data. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of the analysis run, and continuing calibration verification documents that the initial calibration is still valid.

ICP:	1- blank (DoD QSM <½ MRL)	Hg:	1 – blank (DoD QSM <½ MRL)
	3 – standards (r≥0.995)		5 – standards (r≥0.995)
	ICV/CCV (90-110%) (DoD QSM 90-110%)		ICV/CCV (80-120%)(DoD QSM ICV 90-110% & CCV 80-120%)
	MRL (70-130%) (DoD QSM 80-120%)		MRL (80-120%) (DoD QSM 80-120%)
	High Std. (95-105%)		High Std. (95-105%)

- Mercury analysis was performed on 7/26/07, with a correlation coefficient of 0.999.

- Mercury analysis was performed on 7/28/07, with a correlation coefficient of 0.999.

- The mercury ICVs and CCVs met recovery criteria.

- The four samples in this data package were analyzed between CCV16 and CCV22 during the 7/30/07 metals run. All CCVs in this interval met recovery criteria.

- Samples 59SB03B and 59SB03C were analyzed for iron only between CCV8 and CCV10 during the 7/31/07 metals run. All CCVs in this interval met recovery criteria.

- All metals met recovery criteria during the High Standard analysis.

- **Table 2** summarizes the MRL standard analysis. Samples with concentrations detected less than two times the MRL with out of criteria MRL recovery were qualified.

Table 2 MRL Analysis Summary

Analysis Date	Analysis	MRL	MRL %Recovery	Qualified samples @ <2xMRL	Validation Qualifiers
7/26/07	Hg	0.2 ug/l	Met criteria	None	None
7/28/07	Hg	0.2 ug/l	Met criteria	None	None
7/31/07	ICP-Sb	5 ug/l	34.0	072407R	UL
7/31/07	ICP-Pb	5 ug/l	138.0	072407R	K
7/30/07	ICP-Se	10 ug/l	130.0	None	None
7/30/07	ICP-Zn	20 ug/l	121.5	None	None

III-Blanks

Blanks (preparation and calibration blanks) are assessed to determine the existence and magnitude of contamination problems. No contaminants should be detected (i.e. <MDL) in any of the associated blanks. DoD QSM limits are <½MRL for the method blank and <2*MDL for the calibration blanks. Samples are qualified "B" when they are less than 5x the absolute value of the maximum blank concentration. **Table 3** summarizes the blank contamination analysis.

Table 3 Blank Contamination Analysis Summary

Analysis Date	Analysis	QC Blank ID	Max Conc. µg/kg	Action Level µg/kg	B qualified samples
7/30/07	Copper	ICB/CCBs	0.12	0.60	None
7/30/07	Lead	ICB/CCBs	0.315	1.575	None
7/30/07	Magnesium	ICB/CCBs	0.52	2.6	None
7/30/07	Potassium	ICB/CCBs	87	435	None
7/30/07	Selenium	ICB/CCBs	0.25	1.25	None
7/30/07	Sodium	ICB/CCBs	97	485	None
7/30/07	Thallium	ICB/CCBs	0.28	1.4	None
7/26/07	Mercury	ICB/CCBs	<2*MDL	NA	None
7/28/07	Mercury	ICB/CCBs	<2*MDL	NA	None
7/30/07	ICP Metals	MP12607-MB	<½MRL	NA	None
7/30/07	ICP Metals	MP12611-MB*	<½MRL	NA	None
7/26/07	Mercury	MP12575-MB	<½MRL	NA	None
7/28/07	Mercury	MP12598-MB	<½MRL	NA	None
7/31/07	Lead	072407R	0.105 J	0.525	None
7/31/07	Magnesium	072407R	0.265 J	1.325	None
7/31/07	Potassium	072407R	88 J	440	None
7/31/07	Sodium	072407R	96 J	480	None
7/28/07	Mercury	072407R	<½MRL	NA	None

*: MP12611-MB is an aqueous blank.
072407R is a rinsate blank.
J = Estimated value <MRL and >MDL.

IV-ICP Interference Check Sample (ICS)

The ICP interference check sample (ICS) verifies interelement and background correction factors. ICP Interference Check is performed at the beginning and end of each sample analysis run. Control limits are 80-120% (DoD QSM limits 80-120%).

- All criteria were met. No qualifiers were applied.

V-Laboratory Control Samples (LCS)

The laboratory control sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. The DoD LCS recovery limits are specified in Tables D-18 (aqueous) and D-19 (solid matrix) of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample MP12607-BS was used as the LCS during solid matrix ICP metals analysis. All criteria were met. No qualifiers were applied. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this LCS.

- Sample MP12611-BS was used as the LCS during aqueous ICP metals analysis. All criteria were met. No qualifiers were applied. Sample 072407R was analyzed in conjunction with this LCS.

- Sample MP12575-BS was used as the LCS during solid matrix mercury analysis. All criteria were met. No qualifiers were applied. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this LCS.

- Sample MP12598-BS was used as the LCS during aqueous mercury analysis. All criteria were met. No qualifiers were applied. Sample 072407R was analyzed in conjunction with this LCS.

VI-Laboratory Duplicate Sample Analysis
Duplicate sample determinations are used to demonstrate acceptable method precision by the laboratory at the time of analysis. Duplicate analyses are also performed to generate data in order to determine the long-term precision of the analytical method on various matrices. RPDs must be within established control limits. DoD QSM limits for metals are 20% RPD for ICP metals and mercury.

- Sample 59SB03A was analyzed in duplicate during solid matrix ICP metals analysis. Arsenic (22.3%) and calcium (21.0%) had RPDs above criteria – all results for these two metals have been qualified "J". The other metals met RPD criteria. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this laboratory duplicate.

- Sample 072407R was analyzed in duplicate during aqueous ICP metals analysis. Copper (53.7%), iron (200%), magnesium (24.8%), and zinc (200%) had RPDs above criteria; the high RPDs were due to low sample concentrations (<RL) Therefore, no qualifiers were applied. All other metals met RPD criteria. Sample 072407R was analyzed in conjunction with this laboratory duplicate.

- Sample F51247-17 was analyzed in duplicate during solid matrix mercury analysis. The sample was not a RFAAP site sample; therefore, it was not evaluated. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this laboratory duplicate.

- Sample F51314-1 was analyzed in duplicate during aqueous mercury analysis. The sample was not a RFAAP site sample; therefore, it was not evaluated. Sample 072407R was analyzed in conjunction with this laboratory duplicate.

VII-Matrix Spike/Spike Duplicate
MS/MSD are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. Specific criteria include the analyses of matrix spike and matrix spike duplicate samples at a frequency of one MS and MSD per 20 samples of similar matrix. MS and MSD recoveries and relative percent differences between MS and MSD recoveries should be within the specified limits. DoD MS/MSD recovery limits follow the LCS criteria specified in Tables D-18 (aqueous) and D-19 (sold matrix) of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used. Post digestion spikes limits are 75-125% for ICP metals and mercury.

- Sample 59SB03A was used as the MS/MSD during solid matrix ICP metals analysis. Aluminum (28.1%, 36.2%), antimony (10.5%, 9.2%), calcium (65.3%, 62.6%), chromium (74.1%, 73.3%), iron (14.6%, 37.6%), magnesium (69.9%, 69.6%), magnesium (0%, 19.6%), selenium (78.6%, 76.2%), vanadium (79.0%, 77.8%), and zinc (62,7%, 69.6%) had low recoveries in the MS & MSD, while cobalt (79.4%), copper (79.8%), nickel (76.6%), and thallium (78.8%) had low recoveries in the MSD. The results for these metals have been qualified "L/UL". The other metals met recovery criteria, and all metals met RPD criteria. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this MS/MSD.

- Sample 072407R was used as the MS/MSD during aqueous ICP metals analysis. All metals met recovery and RPD criteria. Sample 072407R was analyzed in conjunction with this MS/MSD.

- Sample F51247-17 was used as the MS/MSD during solid matrix mercury analysis. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this MS/MSD.

- Sample F51314-1 was used as the MS/MSD during aqueous mercury analysis. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Sample 072407R was analyzed in conjunction with this MS/MSD.

VIII-ICP Serial Dilution

An ICP serial dilution is performed to determine whether significant physical or chemical interferences exist due to sample matrix at high concentrations. An analysis of a 5-fold dilution should agree within 10% difference of the original result when the concentration in sample is a factor of 50 above MDL.

- Sample 59SB03A was used as the serial dilution during solid matrix ICP metals analysis. Aluminum (13.4%), arsenic (18.3%), barium (13.2%), calcium (18.1%), chromium (17.4%), cobalt (20.4%), copper (11.5%), iron (18.1%), lead (18.9%), magnesium (18.6%), manganese (19.0%), nickel (19.6%), potassium (52.0%), selenium (16.5%), vanadium (16.3%), and zinc (21.0%) had %D > 10%. All detections for these metals have been qualified "J/UJ". The other metals met criteria. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this serial dilution.

- Sample 072407R was used as the serial dilution during aqueous ICP metals analysis. Potassium (389.3%) had a %D > 10%. The potassium detections have been qualified "J". All other metals met criteria. Sample 072407R was analyzed in conjunction with this serial dilution.

- Sample F51247-17 was used as the serial dilution during solid matrix mercury analysis. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this serial dilution.

- Sample F51314-1 was used as the serial dilution during aqueous mercury analysis. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Sample 072407R was analyzed in conjunction with this serial dilution.

IX-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 35% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No field duplicates were included in this data package.

X-Quantitation Verification
The accuracy of analytical results is verified through the calculation of several parameters. The percent difference (%D) between the calculated and the reported values should be within 10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J." The following calculations were performed for verification.

ICP Sample: 59SB03A, Chromium

Conc. (mg/kg) = (conc. μg/L) *(Final Volume L) * (DF) / (Sample weight g) * (Percent solids/100)

Conc. (mg/kg) = (296.2 μg/L)*(0.05 L)*(1) / (1.02)*(0.931) = 15.6 mg/kg

Reported concentration = 15.6 mg/kg
%D = 0.0%
Values were within 10% difference.

CVAA Sample: 59SB03A, Mercury

Conc. (mg/kg) = (conc. μg/L) *(Final Volume L) * (DF) / (Sample weight g) * (Percent solids/100)

Conc. (mg/kg) = (2.70 μg/L)*(0.05 L)*(1) / (0.66)*(0.931) = 0.22 mg/kg

Reported concentration = 0.22 mg/kg
%D = 0.0%.
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

D = Indicates sample was analyzed at a dilution.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

N (Metals) = Laboratory spike sample recovery not within control limits.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Pesticides and PCBs
Accutest Laboratories, Inc., SDG F51275

DATE: December 11, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on July 24, 2007. Samples were analyzed for pesticides using USEPA Methods 3550B/8081A (soils) and 3510C/8081A (waters); and for PCBs using USEPA Methods 3550B/8082 (soils) and 3510C/8082 (waters), respectively. A total of one aqueous and three soil samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
072407R	F51275-1	59SB03B	F51275-3
59SB03A	F51275-2	59SB03C	F51275-4

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Instrument Performance Check
	X	Initial Calibration
X		Continuing Calibration
	X	Blank Analysis
	X	System Monitoring Compounds
X		Laboratory Control Samples
X		Matrix Spike/Spike Duplicate
	X	Field Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

RFAAP VALIDATION REPORT
PESTICIDE/PCB REVIEW
SDG F51275

I-Holding Times and Preservation
The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: Solid samples must be stored @4°C ± 2°C with a maximum holding time of 14 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis. Aqueous samples must be cooled @4°C ± 2°C with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 7/24/07 were sent in two coolers, and were received by the laboratory on 7/25/07 at 2.6 °C & 3.4 °C. No qualifiers were applied.

- Holding Time Review: The samples were collected on 7/24/07. The aqueous sample was extracted for pesticides and PCBs on 7/30/07, analyzed for pesticides on 8/10/07, and analyzed for PCBs on 8/1/07. The solid samples were extracted for pesticides and PCBs on 8/2/07, analyzed for pesticides on 8/8/07 & 8/11/07, and analyzed for PCBs on 8/6/07 and 8/13/07. All criteria were met. No qualifiers were applied.

II-Instrument Performance Check (Degradation Standard)
Performance checks on the gas chromatograph with electron capture detector (GC/ECD) system are performed to ensure adequate resolution and instrument sensitivity. The performance evaluation mixture (PEM) must be analyzed at the beginning of the analytical sequence. The breakdown of Endrin and 4,4'-DDT must be ≤15% on both signals.

- During the analysis beginning 8/6/07 @0925, endrin and 4,4'-DDT percent breakdowns were 11.2% and 7.1% on signal #1, and 10.7% and 5.6% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- During the analysis beginning 8/8/07 @1046, endrin and 4,4'-DDT percent breakdowns were 4.6% and 4.2% on signal #1, and 4.6% and 3.1% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- During the analysis beginning 8/10/07 @1538, endrin and 4,4'-DDT percent breakdowns were 3.7% and 2.5% on signal #1, and 3.9% and 2.0% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- During the analysis beginning 8/11/07 @1054, endrin and 4,4'-DDT percent breakdowns were 3.4% and 2.3% on signal #1, and 3.5% and 2.1% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- During the analysis beginning 8/13/07 @1116, endrin and 4,4'-DDT percent breakdowns were 2.7% and 1.4% on signal #1, and 2.6% and 1.1% on signal #2, respectively. All criteria were met. No qualifiers were applied.

III-Initial Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. The initial 5 point calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run. Calibration factors are generated for each compound. The DoD QSM specifies that the percent relative standard deviation (%RSD) for all single peak target analytes, and aroclors 1016, 1242, 1254, and 1260 must be <20% or the mean %RSD for all analytes in the standard must be ≤20%. If linear regression is used, the correlation coefficient must be ≥0.990. All detects are qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits.

- During the pesticide initial calibration performed on 8/6/07 on instrument ECD6, all criteria were met. No qualifiers were applied. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed following this initial calibration.

- During the pesticide initial calibration performed on 8/10/07 on instrument ECD6, all criteria were met. No qualifiers were applied. Sample 072407R plus the 1:5 dilutions of 59SB03A, 59SB03B, and 59SB03C were analyzed following this initial calibration.

- During the PCB initial calibration performed on 7/28/07 on instrument ECD3, all criteria were met. No qualifiers were applied. Sample 072407R was analyzed following this initial calibration.

- During the PCB initial calibration performed on 8/6/07 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples 59SB03B and 59SB03C were analyzed following this initial calibration.

- During the PCB initial calibration performed on 8/13/07 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples 59SB03A was analyzed following this initial calibration.

IV-Continuing Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for pesticide/PCB target compounds. Continuing calibration standards containing both target compounds and surrogates are analyzed at the beginning of each 12-hour analytical shift and after every 20 samples. The DoD QSM specifies that the percent difference (%D) or the average %Ds for all analytes in the standard from the calibration should be no greater than ±20%.

- During the pesticide initial calibration verification performed on 8/6/07 @1229 on instrument ECD6, all criteria were met. No qualifiers were applied. No samples were analyzed in conjunction with this ICV.

- During the pesticide continuing calibration performed on 8/8/07 @1131 on instrument ECD6, all criteria were met. No qualifiers were applied. A method blank and LCS were analyzed in conjunction with this continuing calibration.

- During the pesticide continuing calibration performed on 8/8/07 @1153 on instrument ECD6, the 4th chlordane peak (20.4%) from signal #2 had a %D outside criteria, but the average %D of all six chlordane peaks was 7.9% which met criteria. No qualifiers were applied. A method blank and LCS were analyzed in conjunction with this continuing calibration.

- During the pesticide continuing calibration performed on 8/8/07 @1209 on instrument ECD6, all criteria were met. No qualifiers were applied. A method blank and LCS were analyzed in conjunction with this continuing calibration.

- During the pesticide continuing calibration performed on 8/8/07 @1528 on instrument ECD6, all criteria were met. No qualifiers were applied. The only sample associated with this continuing calibration was the unspiked MS/MSD (an RFAAP sample but not from this data package).

- During the pesticide continuing calibration performed on 8/8/07 @1838 on instrument ECD6, endrin aldehyde (21.3%) had a high %D on signal #1, while 4,4'-DDT(28.3%, 25.2%) and methoxychlor (25.6%, 24.4%) had a high %D on both signals. All other compounds met criteria. The only sample associated with this continuing calibration was the unspiked MS/MSD (an RFAAP sample but not from this data package). No qualifiers were applied.

- During the pesticide continuing calibration performed on 8/8/07 @1926 on instrument ECD6, heptachlor (24.0%, 23.1%), endrin aldehyde (21.9%, 22.4%), 4,4'-DDT(31.8%, 31.8%), and methoxychlor (31.3%, 32.5%) had a high %D on both signals. The results for these compounds have been qualified "J/UJ" in associated samples. All other compounds met criteria. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed following this continuing calibration.

- During the pesticide continuing calibration performed on 8/8/07 @2116 on instrument ECD6, endrin (20.4%) had a high %D on signal #1, while endrin aldehyde (22.1%, 21.3%), 4,4'-DDT(46.6%, 42.1%), and methoxychlor (40.3%, 35.3%) had a high %D on both signals. The results for these compounds have been qualified "J/UJ" in associated samples. All other compounds met criteria. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed before this continuing calibration.

- During the pesticide initial calibration verification performed on 8/10/07 @1840 on instrument ECD6, all criteria were met. No qualifiers were applied. A method blank and LCS were analyzed following this ICV.

- During the pesticide continuing calibration performed on 8/10/07 @2015 on instrument ECD6, all criteria were met. No qualifiers were applied. A method blank and LCS were analyzed before this continuing calibration, while sample 072407R plus the aqueous MS & MSD were analyzed following with this continuing calibration.

- During the pesticide continuing calibration performed on 8/10/07 @2205 on instrument ECD6, all criteria were met. No qualifiers were applied. Sample 072407R plus the aqueous MS & MSD were analyzed before with this continuing calibration.

- During the pesticide continuing calibration performed on 8/10/07 @2309 on instrument ECD6, all criteria were met. No qualifiers were applied. The solid MS & MSD were analyzed after this continuing calibration.

- During the pesticide continuing calibration performed on 8/11/07 @1110 on instrument ECD6, all criteria were met. No qualifiers were applied. The 1:5 dilution of samples 59SB03A, 59SB03B, and 59SB03C were analyzed after this continuing calibration.

- During the pesticide continuing calibration performed on 8/11/07 @1132 on instrument ECD6, all criteria were met. No qualifiers were applied. The 1:5 dilution of samples 59SB03A, 59SB03B, and 59SB03C were analyzed after this continuing calibration.

- During the pesticide continuing calibration performed on 8/11/07 @1148 on instrument ECD6, all criteria were met. No qualifiers were applied. The 1:5 dilution of samples 59SB03A, 59SB03B, and 59SB03C were analyzed after this continuing calibration.

- During the pesticide continuing calibration performed on 8/11/07 @1400 on instrument ECD6, all criteria were met. No qualifiers were applied. The 1:5 dilution of samples 59SB03A, 59SB03B, and 59SB03C were analyzed before this continuing calibration.

- During the PCB 1016/1260 initial calibration verification performed on 7/28/07 @1459 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples were analyzed following this initial calibration verification.

- During the PCB 1016/1260 continuing calibration performed on 8/1/07 @1521 on instrument ECD3, all criteria were met. No qualifiers were applied. Sample 072407R, the aqueous method blank, the aqueous LCS, and the aqueous MS/MSD were analyzed following this continuing calibration.

- During the PCB 1016/1260 continuing calibration performed on 8/1/07 @1833 on instrument ECD3, all criteria were met. No qualifiers were applied. Sample 072407R, the aqueous method blank, the aqueous LCS, and the aqueous MS/MSD were analyzed before this continuing calibration.

- During the PCB 1016/1260 initial calibration verification performed on 8/6/07 @1556 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples were analyzed following this initial calibration verification.

- During the PCB 1016/1260 continuing calibration performed on 8/6/07 @1906 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples 59SB03B and 59SB03C plus the solid method blank, the solid LCS, and the solid MS/MSD were analyzed after this continuing calibration.

- During the PCB 1016/1260 continuing calibration performed on 8/6/07 @2214 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples 59SB03B and 59SB03C plus the solid method blank, the solid LCS, and the solid MS/MSD were analyzed before this continuing calibration.

- During the PCB 1016/1260 initial calibration verification performed on 8/13/07 @1416 on instrument ECD3, all criteria were met. No qualifiers were applied. Sample 59SB03A was analyzed following this initial calibration verification.

- During the PCB 1016/1260 continuing calibration performed on 8/13/07 @1719 on instrument ECD3, all criteria were met. No qualifiers were applied. Sample 59SB03A was analyzed before this continuing calibration.

V-Blank Analysis

The purpose of laboratory or field blank analyses is to determine the existence and magnitude of contamination problems resulting from laboratory or field activities. One method blank per analytical batch must be run on each instrument used to analyze samples. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤5 times (5X) the maximum amount for pesticide and PCB target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Parameter	Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
Pesticides	8/10/07	OP21657-MB	All target <½MRL	NA	NA	None
Pesticides	8/8/07	OP21716-MB	All target <½MRL	NA	NA	None
Pesticides	8/11/07	OP21716-MB	All target <½MRL	NA	NA	None
Pesticides	8/10/07	072407R	All target <½MRL	NA	NA	None
PCBs	8/1/07	OP21658-MB	All target <½MRL	NA	NA	None
PCBs	8/6/07	OP21715-MB	All target <½MRL	NA	NA	None
PCBs	8/1/07	072407R	All target <½MRL	NA	NA	None

072407R is a rinsate blank.
NA = Not Applicable
MRL = Method Reporting Limit

VI-System Monitoring Compound (Surrogates)
Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Surrogate spikes are added to all samples and blanks to measure their recovery in sample and blank matrices. The percent recoveries (%Rs) must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Criteria:	Pesticides:	Tetrachloro-m-xylene: 42-127% (DoD QSM 25-140%) Decachlorobiphenyl: 27-127% (DoD QSM 30-135%)
	PCBs:	Tetrachloro-m-xylene: 38-127% (DoD QSM Not Listed) Decachlorobiphenyl: 25-137% (DoD QSM 40-135%)
Solid Criteria:	Pesticides:	Tetrachloro-m-xylene: 46-122% (DoD QSM 70-125%) Decachlorobiphenyl: 50-133% (DoD QSM 55-130%)
	PCBs:	Tetrachloro-m-xylene: 44-126% (DoD QSM Not Listed) Decachlorobiphenyl: 39-157% (DoD QSM 60-125%)

- Sample 59SB03A had a low tetrachloro-m-xylene recovery (61.3%) from signal #1 during pesticide analysis. No data qualification is required unless two surrogates are outside criteria.

- All other samples met surrogate recovery criteria during pesticide analysis.

- All samples met surrogate recovery criteria during PCB analysis.

VII-Laboratory Control Samples
Laboratory control samples (LCS) are used to monitor laboratory accuracy by calculating the percent recoveries of the spiked compounds. All LCS percent recoveries must be within the specified control limits. DoD QSM solid matrix LCS recovery limits are specified in Tables D-15 and D-17 of the DoD QSM (DoD, 2006), while aqueous LCS recovery limits are specified in Tables D-14 and D-16 of the DoD QSM. If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP21657-BS was used as the aqueous LCS during the 8/10/07 pesticide analysis. Endrin aldehyde (15%) had a low recovery, and was not detected in any field samples – the results have been qualified "UL" as estimated in associated samples. All other pesticides met recovery criteria. Sample 072407R was analyzed in conjunction with this LCS.

- Sample OP21716-BS was used as the solid LCS during the 8/8/07 pesticide analysis. Delta-BHC (53%) and endrin aldehyde (12%) had low recoveries, and were not detected in any field samples. The results for both compounds have been qualified "UL" as estimated in associated samples. All other pesticides met recovery criteria. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this LCS.

- Sample OP21658-BS was used as the aqueous LCS during the 8/1/07 PCB analysis. All criteria were met. No qualifiers were applied.

- Sample OP21715-BS was used as the solid LCS during the 8/6/07 PCB analysis. All criteria were met. No qualifiers were applied.

VIII-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD solid matrix MS/MSD recovery limits follow the LCS criteria specified in Tables D-15 and D-17 of the DoD QSM (DoD, 2006), while aqueous MS/MSD recovery limits follow the LCS criteria specified in Tables D-14 and D-16 of the DoD QSM. If the compound is not listed, then the laboratory criteria shall be used.

- Sample F51353-8 was used for the aqueous pesticide MS/MSD analysis. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Sample 072407R was analyzed in conjunction with this MS/MSD.

- Sample F51300-11 was used for the solid matrix pesticide MS/MSD analysis. Delta-BHC (51%) and endrin aldehyde (0%, 0%) had low recoveries in the MS and MSD, as well as having low recoveries in the associated LCS. All sample results have already been qualified "UL", no further qualification is required. All other pesticides met criteria. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this MS/MSD.

- Sample F51314-1 was used for the aqueous PCB MS/MSD analysis. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Sample 072407R was analyzed in conjunction with this MS/MSD.

- Sample F51300-1 was used for the solid matrix PCB MS/MSD analysis. All PCBs met criteria. No data qualifiers were applied. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this MS/MSD.

IX-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No field duplicates were included in this data package.

X-Quantitation Verification
The accuracy of analytical results was verified through the calculation of several parameters. The difference between the calculated value and the reported value must be within 10% difference. All positive values must have less than or equal to 40% %D between the primary and secondary columns. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J." All criteria were met.

Sample: OP21716-BS, beta-BHC

Conc. µg/kg = (Ax * Vt * DF) / (CF * Vi * Ws * Ps * 1000)

where: Ax = Area response for the compound being measured
Vt = Total volume of extract, taking into account dilutions (uL)
DF = Dilution factor
CF = Calibration Factor from initial calibration (area/pg)
Vi = Volume of extract injected (uL)
Ws = weight of sample (g)
Ps = percent solids/100

Conc. µg/kg = (705390 * 10000 * 1) / (19750 * 1 * 30 * 1 * 1000)
= 11.9 ug/kg

Reported Conc. = 11.9 µg/kg
%D = 0.0%
Values were within 10% difference

Sample: OP21715-BS, Aroclor 1260

Conc. µg/kg = (Ax * Vt * DF) / (CF * Vi * Ws * Ps * 1000)

where: Ax = Area response for the compound being measured
Vt = Total volume of extract, taking into account dilutions (uL)
DF = Dilution factor
CF = Calibration Factor from initial calibration (area/pg)
Vi = Volume of extract injected (uL)
Ws = weight of sample (g)
Ps = percent solids/100

Signal #1
Conc1 µg/L = (3211932 * 10000* 1) / (8380 * 1 * 30 * 1000) = 127.76 µg/kg
Conc2 µg/L = (4273339 * 10000* 1) / (10410 * 1 * 30 * 1000) = 136.83 µg/kg
Conc3 µg/L = (4293784 * 10000* 1) / (10450 * 1 * 30 * 1000) = 136.96 µg/kg
Conc4 µg/L = (2923739 * 10000* 1) / (7516 * 1 * 30 * 1000) = 129.67 µg/kg
Conc5 µg/L = (6792273 * 10000* 1) / (17360 * 1 * 30 * 1000) = 130.42 µg/kg
Conc6 µg/L = (3912029 * 10000* 1) / (9980 * 1 * 30 * 1000) = 130.66 µg/kg
Average concentration = 132 µg/kg

Reported Value = 132 µg/kg (from signal #1)
% Difference = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

N (Metals) = Laboratory spike sample recovery not within control limits.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Semi-Volatiles & Polynuclear Aromatic Hydrocarbons Accutest Laboratories, Inc., SDG F51275

DATE: December 10, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on July 24, 2007. Samples were analyzed for semivolatile organic compounds (SVOCs) using USEPA SW846 Methods 3550B/8270C (solids) and 3510C/8270C (aqueous). The polynuclear aromatic hydrocarbons (PAHs) were analyzed using selective ion monitoring (SIM) techniques. A total of one aqueous and three soil samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
072407R	F51275-1	59SB03B	F51275-3
59SB03A	F51275-2	59SB03C	F51275-4

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Instrument Performance Check
	X	Initial Calibration
	X	Continuing Calibration
	X	Blank Analysis
	X	Surrogate Spikes
	X	Internal Standards

RFAAP VALIDATION REPORT
SEMIVOLATILES AND PAH REVIEW
SDG F51275

I-Holding Times and Preservation
The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: Solid samples must be stored @4°C ± 2°C with a maximum holding time of 14 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis. Aqueous samples must be cooled @4°C ± 2°C with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 7/24/07 were sent in two coolers, and were received by the laboratory on 7/25/07 at 2.6 °C & 3.4 °C. No qualifiers were applied.

- Holding Time Review: The samples were collected on 7/24/07, extracted for SVOCs on 7/31/07 (aqueous) & 8/2/07 (solids), extracted for PAHs by SIM on 7/31/07 (aqueous) & 8/2/07 (solids), analyzed for SVOCs on 8/2/07 (aqueous) & 8/3/07 (solids), and analyzed for PAHs by SIM on 8/2/07 (aqueous) & 8/6/07 (solids). All criteria were met. No qualifiers were applied.

II-Instrument Performance Check
GC/MS instrument performance checks are performed to ensure mass resolution, identification and, to some degree, sensitivity. The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed.

- The instrument performance check, decafluorotriphenylphosphine (DFTPP), met the ion abundance criteria. No qualification was applied.

III-Initial Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for compounds on the semivolatile target compound list (TCL). Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. For compounds analyzed using linear regression or second order, correlation coefficients must be >0.995 and coefficients of determination >0.99. The minimum relative response factor (RRF) criteria must be ≥0.05. The DoD QSM specifies that the initial calibration percent relative standard deviation (%RSD) must be ≤15% on the average for all compounds (<30% for CCCs). All detects are qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- Initial calibration for the SVOCs was performed on 7/5/07 using instrument MSBNA02 (GCMSL). Target compounds 2,4-dinitrophenol (19.68%) and 4,6-dinitro-2-methylphenol (25.87%) had %RSDs outside criteria. All other target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). The compounds with high %RSD were quantified using linear or second order regression, and had correlation coefficients ≥0.995; therefore no qualifiers were applied. Sample 072407R were analyzed in conjunction with this initial calibration.

- Initial calibration for the SVOCs was performed on 7/13/07 using instrument MSBNA04 (GCMSU). Target compounds 2,4-dinitrophenol (42.04%) and 4,6-dinitro-2-methylphenol (24.04%) had %RSDs outside criteria. All other target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). The compounds with high %RSD were quantified using linear or second order regression, and had correlation coefficients ≥0.995; therefore no qualifiers were applied. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this initial calibration.

- Initial calibration for the PAHs-SIM was performed on 7/18/07 using instrument MSBNA3 (GCMSR). All target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05); no qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used was capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Continuing calibration standards containing both target and surrogates compounds are analyzed at the beginning of each 12-hour analysis period following the analysis of the instrument performance check and prior to the analysis of blanks and samples. The minimum relative response factors (RRF) for semivolatile target compounds and surrogates must be ≥0.05. The DoD QSM specifies that the percent difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within ±20% for all target compounds. Grossly exceeding is defined where %D>40%. All detects are qualified as estimated "J" for where there were exceeding %Ds, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- During the SVOC initial calibration verification performed on 7/5/07 @1527 using instrument MSBNA02 (GCMSL), 3-nitroaniline (26.0%) had %D outside criteria. All other target compounds met criteria. No samples were analyzed following this initial calibration verification, no qualifiers were applied.

- During the SVOC initial calibration verification performed on 7/5/07 @1555 using instrument MSBNA02 (GCMSL), all target compounds met criteria. No samples were analyzed following this initial calibration verification, no qualifiers were applied.

- During the SVOC continuing calibration performed on 8/1/07 @1616 using instrument MSBNA02 (GCMSL), 2,4-dinitrophenol (33.0%) and 4,6-dinitro-2-methylphenol (22.1%) had %D outside criteria. All other target compounds met criteria. The MS and MSD were the only samples analyzed following this continuing calibration. Therefore, no qualifiers were applied.

- During the SVOC continuing calibration performed on 8/2/07 @1324 using instrument MSBNA02 (GCMSL), all target compounds met criteria. No qualifiers were applied. Sample 072407R was analyzed following this continuing calibration.

- During the SVOC initial calibration verification performed on 7/13/07 @1348 using instrument MSBNA04 (GCMSU), 4-chloroaniline (38.2%) and 3-nitroaniline (39.0%) had %D outside criteria. All other target compounds met criteria. No samples were analyzed following this initial calibration verification, no qualifiers were applied.

- During the SVOC initial calibration verification performed on 7/13/07 @1419 using instrument MSBNA04 (GCMSU), all target compounds met criteria. No samples were analyzed following this initial calibration verification, no qualifiers were applied.

- During the SVOC continuing calibration performed on 8/3/07 @0952 using instrument MSBNA04 (GCMSU), all target compounds met criteria. No qualifiers were applied. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed following this continuing calibration.

- During the PAH-SIM initial calibration verification performed on 7/18/07 @0634 using instrument MSBNA3 (GCMSR), all criteria were met for all target compounds. No qualifiers were applied. No samples were analyzed following this initial calibration verification.

- During the PAH-SIM continuing calibration performed on 8/2/07 @1000 using instrument MSBNA3 (GCMSR), all criteria were met for all target compounds. No qualifiers were applied. Sample 072407R was analyzed following this continuing calibration.

- During the PAH-SIM continuing calibration performed on 8/6/07 @2107 using instrument MSBNA3 (GCMSR), all criteria were met for all target compounds. No qualifiers were applied. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed following this continuing calibration.

V-Blank Analysis

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. A method blank analysis must be performed after the calibration standards and once every 12-hour time period beginning with the injection of DFTPP. No contaminants should be detected in any of the associated blanks > the MDL. DoD QSM criteria specifies all concentrations should be less than one-half MRL (<MRL for common laboratory contaminants phthalate esters). Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants phthalate esters, or 5 times (5X) the maximum amount for other semivolatile target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/kg	Action Level µg/kg	B qualified samples
8/2/07	OP21675-MB	All SVOC target <½MRL	NA	NA	None
8/3/07	OP21718-MB	All SVOC target <½MRL	NA	NA	None
8/2/07	OP21676-MB	All PAH SIM target <½MRL	NA	NA	None
8/6/07	OP21719-MB	All PAH SIM target <½MRL	NA	NA	None
8/2/07	072407R	All SVOC target <½MRL	NA	NA	None
8/2/07	072407R	All PAH SIM target <½MRL	NA	NA	None

072407R is a rinsate blank.
NA = Not applicable.
MRL = Method reporting limit.

VI-Surrogate Spikes

Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Surrogate spikes are added to all samples and blanks to measure their recovery in sample and blank matrices. The percent recoveries (%Rs) must be within the specified control limits. DoD surrogate recovery limits are specified in Tables D-2 & D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Criteria:
2-Fluorophenol (14-62%) – (DoD QSM = 20-110%)
Phenol-d5 (10-40%) – (DoD QSM = 10-115%)
2,4,6-Tribromophenol (33-118%) – (DoD QSM = 40-125%)
Nitrobenzene-d5 (42-108%) – (DoD QSM = 40-110%)
2-Fluorobiphenyl (40-106%) – (DoD QSM = 50-110%)
p-Terphenyl-d14 (39-121%) – (DoD QSM = 50-135%)

Solid Criteria:

2-Fluorophenol (40-102%) – (DoD QSM = 35-105%)
Phenol-d5 (41-100%) – (DoD QSM = 40-100%)
2,4,6-Tribromophenol (42-108%) – (DoD QSM = 35-125%)
Nitrobenzene-d5 (40-105%) – (DoD QSM = 35-100%)
2-Fluorobiphenyl (43-107%) – (DoD QSM = 45-105%)
p-Terphenyl-d14 (45-119%) – (DoD QSM = 30-125%)

- Sample 072407R had all three base/neutral surrogates with high recoveries during PAH analysis. No PAHs were detected in 072407R, no data qualification was required.

- All other samples met surrogate recovery criteria. No qualifiers were applied.

VII-Internal Standards

Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Internal standard area counts for samples and blanks must not vary by more than a factor of two (-50% to +100%) from the associated calibration standard. The retention time of the internal standards in samples and blanks must not vary by more than ±30 seconds from the retention time of the associated calibration standard.

- All criteria were met. No qualifiers were applied.

VIII-Laboratory Control Sample

Laboratory control samples (LCS) are used to monitor laboratory accuracy by calculating the percent recoveries of the spiked compounds. All LCS percent recoveries must be within the specified control limits. DoD solid matrix LCS recovery limits are specified in Table D-7 of the DoD QSM (DoD, 2006), while aqueous recovery limits are specified in Table D-6 of the DoD QSM. If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP21675-BS was used as the aqueous LCS during SVOC analysis on 8/2/07. All compounds met recovery criteria. No qualifiers were applied. Sample 072407R was analyzed in conjunction with this LCS.

- Sample OP21718-BS was used as the solid LCS during SVOC analysis on 8/3/07. All compounds met recovery criteria. No qualifiers were applied. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this LCS.

- Sample OP21676-BS was used as the aqueous LCS for the PAH-SIM analysis on 8/2/07. All compounds met recovery criteria. No qualifiers were applied. Sample 072407R was analyzed in conjunction with this LCS.

- Sample OP21719-BS was used as the solid LCS for the PAH-SIM analysis on 8/6/07. All compounds met recovery criteria. No qualifiers were applied. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this LCS.

IX-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD solid matrix MS/MSD recovery limits follow the LCS criteria specified in Table D-7 of the DoD QSM (DoD, 2006), while aqueous recovery limits follow the LCS criteria in Table D-6 of the DoD QSM. If the compound is not listed, then the laboratory criteria shall be used.

- Sample F51272-6 was used as the aqueous MS/MSD during SVOC analysis on 8/1/07. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Sample 072407R was analyzed in conjunction with this MS/MSD.

- Sample F51300-5 (an RFAAP sample in data package F51300) was used as the solid MS/MSD during SVOC analysis on 8/3/07. All target compounds met recovery criteria. No qualifiers were applied. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this MS/MSD.

- Sample F53100-31 (an RFAAP sample in data package F51300) was used as the aqueous MS/MSD during PAH SIM analysis on 8/2/07. All compounds met recovery criteria. No qualifiers were applied. Sample 072407R was analyzed in conjunction with this MS/MSD.

- Sample F53100-7 (an RFAAP sample in data package F51300) was used as the solid MS/MSD during PAH SIM analysis on 8/7/07. Chrysene (52%, 53%) and 1-methylnaphthalene (56%, 57%) had low recoveries in the MS & MSD; all chrysene and 1-methylnaphthalene results in associated samples have been qualified "J/UJ". All other target compounds met recovery criteria. Samples 59SB03A, 59SB03B, and 59SB03C were analyzed in conjunction with this MS/MSD.

X-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No field duplicates were included in this data package.

XI-Quantitation Verification

The accuracy of analytical results was verified through the calculation of several parameters. Percent difference (%D) between the calculated and reported values must be ≤10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J."

Sample: F51300-7 MSD, pyrene

Conc. (µg/kg) = {(Ax)*(Is)*(Vt)*(DF)}/{(Ais)*(RRF)*(V_i)*(Ws)*(Ps)}

where:	Conc	=	Sample concentration in µg/kg
	A_x	=	Area of characteristic ion for compound being measured.
	I_s	=	Amount of internal standard injected (ng).
	V_t	=	Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10,000 µL.
	DF	=	Dilution Factor
	A_{is}	=	Area of characteristic ion for the internal standard.
	RRF_A	=	Average relative response factor for compound being measured
	V_i	=	Volume of extract injected (µL).
	Ws	=	weight of sample (g)
	Ps	=	percent solids/100

Conc. µg/L = (213250 * 4 * 1000 * 4) / (115975 * 2.134 * 1 * 30.1 * 0.866) = 529 ug/kg

Reported Value = 529 µg/kg
% Difference = 0.0%
Values were within 10% difference.

Sample: F51300-5 MSD, 1,2-dichlorobenzene

Conc. (µg/kg) = {(Ax)*(Is)*(Vt)*(DF)}/{(Ais)*(RRF)*(V_i)*(Ws)*(Ps)}

where:	Conc	=	Sample concentration in µg/kg
	A_x	=	Area of characteristic ion for compound being measured.
	I_s	=	Amount of internal standard injected (ng).
	V_t	=	Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10,000 µL.
	DF	=	Dilution Factor
	A_{is}	=	Area of characteristic ion for the internal standard.
	RRF_A	=	Average relative response factor for compound being measured
	V_i	=	Volume of extract injected (µL).
	Ws	=	weight of sample (g)
	Ps	=	percent solids/100

Conc. µg/L = (192226 * 40 * 1000 * 1) / (220274 * 1.477 * 1 * 30.5 * 0.842) = 920 ug/kg

Reported Value = 921 µg/kg
% Difference = 0.1%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation - Volatiles
Accutest Laboratories, Inc., SDG F51275

DATE: December 10, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on July 24, 2007. The samples were analyzed for target compound list (TCL) volatile organic compounds (VOCs) using USEPA SW846 Method 5030B/8260B for aqueous samples and 5035A/8260B for soil samples. A total of three aqueous and three soil samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
072407R	F51275-1	59SB03C	F51275-4
59SB03A	F51275-2	TB072407S	F51275-5
59SB03B	F51275-3	TB072407W	F51275-6

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No

RFAAP VALIDATION REPORT
VOLATILES REVIEW
SDG F51275

I-Holding Times and Preservation
The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of analysis. Holding time criteria: Aqueous samples must be cooled @ 4°C±2°C and acidified to pH<2 with HCl, with a maximum holding time of 14 days (7 days if no HCl added) from sample collection to analysis. Soil samples must be cooled @ 4°C±2°C, with a maximum holding time of 14 days from sample collection to analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 7/24/07 were sent in two coolers, and were received by the laboratory on 7/25/07 at 2.6 °C & 3.4 °C. No qualifiers were applied.

- Holding Time Review: All samples were collected for VOCs on 7/24/07. The rinsate blank (072407R) and associated trip blank (TB072407W) were analyzed on 7/31/07, all other samples were analyzed on 7/30/07. All criteria were met. No qualifiers were applied.

II-Instrument Performance Check
The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed.

- The instrument performance check, bromofluorobenzene (BFB), met the ion abundance criteria. No qualification was applied.

III-Initial Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The RRF must be greater than 0.1 for chloromethane, 1,1-dichloroethane, and bromoform and greater than 0.3 for 1,1,2,2-tetrachloroethane and chlorobenzene. The minimum relative response factor (RRF) must be ≥0.05 for all other compounds. The DoD QSM specifies that the percent relative standard deviation (%RSD) must be ≤15% for each target compound and must be ≤30% for each calibration check compound. For compounds analyzed using linear regression or second order, correlation coefficients must be >0.995 and coefficients of determination >0.99. All detects are qualified as estimated "J" for exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For compounds with low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- During the initial calibration performed on 07/16/07 on instrument MSVOA3 (GCMSH), target compounds acetone (18.53%), methylene chloride (32.02%), trichloroethene (24.48%), ethylbenzene (15.12%), m,p-xylene (16.56%), and o-xylene (15.44%) were outside %RSD criteria. All other target compounds met %RSD criteria, and all compounds met RRF criteria. The compounds with high %RSD were quantified using linear or second order regression, and had correlation coefficients >0.995; therefore, no qualifiers were applied. Samples 59SB03A, 59SB03B, 59SB03C, and TB072407S were analyzed in conjunction with this initial calibration.

- During the initial calibration performed on 07/31/07 on instrument MSVOA6 (GCMSJ), target compounds bromomethane (22.0%), chloroethane (21.95%), methylene chloride (123.02%), and trans-1,3-dichloropropene (21.19%) were outside %RSD criteria. All other target compounds met %RSD criteria, and all compounds met RRF criteria. The compounds with high %RSD were quantified using linear or second order regression, and had correlation coefficients >0.995; therefore, no qualifiers were applied. Samples 072407R and TB072407W were analyzed in conjunction with this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Continuing calibration establishes the 12-hour relative response factors on which the quantitations are based and checks satisfactory performance of the instrument on a day-to-day basis. The RRF must be greater than 0.1 for chloromethane, 1,1-dichloroethane, and bromoform and greater than 0.3 for 1,1,2,2-tetrachloroethane and chlorobenzene. The minimum relative response factor (RRF) must be ≥0.05 for all other compounds. The DoD QSM specifies that the percent difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within 20% for all target compounds. All detects are qualified as estimated "J" for exceeding %Ds, and all non-detects are qualified as estimated "UJ" for grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- During the initial calibration verification performed on 7/16/07 @1820 on instrument MSVOA3 (GCMSH), bromomethane (36.1%) had a %D outside criteria. No bromomethane (reported on Form I as methyl bromide) was detected in any samples so no data qualification was required. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). No samples were analyzed following this initial calibration verification.

- During the continuing calibration performed on 7/30/07 @1207 on instrument MSVOA3 (GCMSH), acetone (43.7%), trichloroethene (21.1%), and 2-hexanone (27.0%) had %D/%drift outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). None of these volatiles were detected in any of the associated samples, the acetone results have been qualified "UJ", no other data qualification was required. Samples 59SB03A, 59SB03B, 59SB03C, and TB072407S were analyzed following this continuing calibration.

- During the initial calibration verification performed on 7/31/07 @1339 on instrument MSVOA6 (GCMSJ), bromomethane (21.8%), acetone (22.5%), trans-1,3-dichloropropene (20.5%), had a %D outside criteria. None of these compounds were detected in any samples so no data qualification was required. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). Samples 072407R and TB072407W were analyzed following this initial calibration verification.

- During the continuing calibration performed on 7/31/07 @1427 on instrument MSVOA6 (GCMSJ), all target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). Samples 072407R and TB072407W were analyzed following this initial calibration verification.

V-Blank Analysis

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. A method blank analysis must be performed after the calibration standards and once every 12-hour time period beginning with the injection of BFB. No contaminants should be detected in any of the associated blanks > the MDL. The DoD QSM criteria specifies all concentrations should be less than one-half MRL (<MRL for common laboratory contaminants methylene chloride, acetone, and 2-butanone). Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants methylene chloride, acetone, and 2-butanone (MEK), or 5 times (5X) the maximum amount for other volatile target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
7/30/07	VH1664-MB	All target <½MRL	NA	NA	None
7/31/07	VJ2191-MB	All target <½MRL	NA	NA	None
7/31/07	072407R	All target <½MRL	NA	NA	None
7/30/07	TB072407S	All target <½MRL	NA	NA	None
7/31/07	TB072407W	All target <½MRL	NA	NA	None

072407R is a rinsate blank.
NA = Not Applicable
MRL = Method Reporting Limit

VI-Laboratory Control Sample

Data for laboratory control samples (LCS) are evaluated to determine long-term accuracy of the analytical method on various matrices. Percent recoveries (%Rs) should be within the specified control limits. The aqueous LCS recovery limits are specified in Table D-4 of the DoD QSM (DoD, 2006), while the solid matrix LCS recovery limits are specified in Table D-5 of the DoD QSM. If the compound is not listed, then the laboratory criteria shall be used.

- Sample VH1664-BS was used as the solid LCS for the VOC analysis on 7/30/07. All target compound recoveries were within criteria. Samples 59SB03A, 59SB03B, 59SB03C, and TB072407S were analyzed in conjunction with this LCS.

- Sample VJ2191-BS was used as the aqueous LCS for the VOC analysis on 7/31/07. All target compound recoveries were within criteria. Samples 072407R and TB072407W were analyzed in conjunction with this LCS.

VII-Matrix Spike/Matrix Spike Duplicate

Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. The MS/MSD aqueous recovery limits follow the LCS criteria specified in Table D-4 of the DoD QSM (DoD, 2006), while the solid matrix recovery limits follow the LCS criteria specified in Table D-5 of the DoD QSM. If the compound is not listed, then the laboratory criteria shall be used.

- Sample F51247-13 was used for the solid MS/MSD analysis on 7/30/07. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Samples 59SB03A, 59SB03B, 59SB03C, and TB072407S were analyzed in conjunction with this MS/MSD.

- Sample F51154-17 (LFSW01, an RFAAP sample in data package F51154) was used for the aqueous MS/MSD analysis on 07/31/07. Bromomethane (146%, 148%) was outside DoD QSM criteria. The associated LCS was met recovery for bromomethane, and no bromomethane was detected in any associated samples; therefore, no qualifiers were applied. All other target compounds met recovery criteria. Samples 072407R and TB072407W were analyzed in conjunction with this MS/MSD.

VIII-System Monitoring Compounds (Surrogates)
Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Recoveries for system monitoring compounds in volatile samples and blanks must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous criteria:	Dibromofluoromethane (87-116%) (DoD QSM = 85-115%) 1,2-Dichloroethane-d4 (76-127%) (DoD QSM = 70-120%) Toluene-d8 (86-112%) (DoD QSM = 85-120%) 4-Bromofluorobenzene (84-120%) (DoD QSM = 75-120%)
Solid matrix criteria:	Dibromofluoromethane (80-121%) (DoD QSM = none) 1,2-Dichloroethane-d4 (77-123%) (DoD QSM = none) Toluene-d8 (71-130%) (DoD QSM = 85-115%) 4-Bromofluorobenzene (59-148%) (DoD QSM = 85-120%)

- Sample 59SB03A had a high 4-bromofluorobenzene (130.0%) recovery. All results in 59SB03A have been qualified "J/UJ".

- All other solid matrix samples and all aqueous samples met surrogate recovery criteria. No qualifiers were applied.

IX-Internal Standards (IS)
Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Specific criteria include: area counts (-50% to +100%) of the associated calibration standard, and retention time (± 30 seconds) from that of the associated calibration standard.

- The solid matrix MS (F51247-13MS) had a low tert-butyl alcohol-d10 recovery, but no target compounds are quantitated from this internal standard. All other solid matrix samples and all aqueous samples met criteria. No qualifiers were applied.

X-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No field duplicates were included in this data package.

XI-Quantitation Verification
The accuracy of analytical results is verified through the calculation of several parameters. The percent difference (%D) between the calculated and the reported values should be within 10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J."

Sample: VH1664-BS, 1,1-dichloroethylene

Conc. (µg/kg) = (Ax * Is * DF)/(Ais * RRF * Ws * Ps)

where:	Conc	=	sample concentration in µg/kg
	Ax	=	area of characteristic ion for compound being measured
	Is	=	amount of internal standard added (ng)
	DF	=	dilution factor
	Ais	=	Area of characteristic ion for the internal standard
	RRF	=	average relative response factor
	Ws	=	weight of sample (g)
	Ps	=	percent solids/100

Conc. µg/L = (578404 * 250 ng * 1) / (1058832 * 0.634 * 5 * 1) = 43.1 µg/kg

Reported Conc. = 43.1 µg/kg
%D = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Explosives, PETN, & Nitroglycerin
Accutest Laboratories, Inc., SDG F51300

DATE: December 28, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on July 25, 2007. The samples were analyzed for explosives using USEPA SW846 Method 8330A, and nitroglycerin & PETN using USEPA SW-846 Method 8332A. A total of 1 aqueous and 30 soil samples were validated. The sample IDs are:

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

RFAAP VALIDATION REPORT
EXPLOSIVES REVIEW
SDG F51300

I-Holding Times and Preservation

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Solid samples must be cooled @4°C ± 2°C, with a maximum holding time of 14 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis. Aqueous samples must be cooled @4°C ± 2°C, with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 7/25/07 were sent in five coolers, and were received by the laboratory on 7/26/07 at temperatures ranging from 2.6 °C to 4.0 °C. No qualifiers were applied.

- Holding Time Review: The samples were collected on 7/25/07. The water sample was extracted on 7/31/07, while the soils were extracted on 8/7/07. The water sample was analyzed for all explosives on 8/1/07; the soils were analyzed for PETN & nitroglycerine on 8/8/07, and for all other explosives on 8/9/07 & 8/10/07. All criteria were met. No qualifiers were applied.

II-Blank Analysis

The purpose of laboratory or field blank analyses is to determine the existence and magnitude of contamination problems resulting from laboratory or field activities. One method blank per analytical batch must be run on each instrument used to analyze samples. No contaminants should be present in the blanks. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤5 times (5x) the maximum amount for explosive target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
8/1/07	OP21682-MB	All target explosives <½MRL	NA	NA	None
8/1/07	OP21682-MB	PETN & NG <½MRL	NA	NA	None
8/9/07	OP21778-MB	All target explosives <½MRL	NA	NA	None
8/8/07	OP21778-MB	PETN & NG <½MRL	NA	NA	None
8/9/07	OP21779-MB	All target explosives <½MRL	NA	NA	None
8/8/07	OP21779-MB	PETN & NG <½MRL	NA	NA	None
8/1/07	072507R	All target explosives <½MRL	NA	NA	None
8/1/07	072507R	PETN & NG <½MRL	NA	NA	None
8/1/07	072607R	All target explosives <½MRL	NA	NA	None
8/1/07	072607R	PETN & NG <½MRL	NA	NA	None

072507R and 072606R are rinsate blanks.
MRL = Method Reporting Limit
NA = Not Applicable

III-Initial Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. The initial 5-point calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run. The DoD QSM specifies that the correlation coefficient (r^2) must be ≥0.990 and/or the percent relative standard deviation (%RSD) must be ≤20%. All detects were qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects were qualified as estimated "UJ" for where there were grossly exceeding recoveries. Grossly exceeding is defined as twice the established criteria limits.

- During the explosives initial calibration performed on 10/18/06 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

- During the PETN and nitroglycerine initial calibration performed on 03/15/07 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. Continuing calibration standards are analyzed after every 10 injections, and at the end of the analysis sequence. The DoD QSM specifies that the percent difference (%D) from initial calibration should be no greater than ±20%. All detects were qualified as estimated "J" for where there were exceeding %Ds, and all non-detects were qualified as estimated "UJ" for where there were grossly exceeding recoveries. Grossly exceeding is defined as twice the established criteria limits.

- During the explosives initial calibration verification performed on 10/18/06 @1739 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples were analyzed after this initial calibration verification.

- During the explosives initial calibration verification performed on 10/19/06 @1344 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples were analyzed after this initial calibration verification.

- During the explosives continuing calibration verification performed on 8/1/07 @1220 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Sample F51300-31 was analyzed following this continuing calibration.

- During the explosives continuing calibration verification performed on 8/1/07 @1705 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Sample F51300-31 was analyzed before this continuing calibration.

- During the explosives continuing calibration verification performed on 8/8/07 @2354 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 51300-19, -20, -21, -22, -23, -24, and -26 were analyzed after this continuing calibration.

- During the explosives continuing calibration verification performed on 8/9/07 @0457 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 51300-19, -20, -21, -22, -23, -24, and -26 were analyzed before this continuing calibration, while samples 51300-27, -28, -29, and -30 were analyzed after this continuing calibration.

- During the explosives continuing calibration verification performed on 8/9/07 @0915 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 51300-27, -28, -29, and -30 were analyzed before this continuing calibration.

- During the explosives continuing calibration verification performed on 8/9/07 @1050 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples F51300-1, -2, -3, -4, -5, and -6 were analyzed after this continuing calibration.

- During the explosives continuing calibration verification performed on 8/9/07 @1553 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples F51300-1, -2, -3, -4, -5, and -6 were analyzed before this continuing calibration, while samples F51300-7, -8, -9, -10, -11, -12, -13, -14, -15, and -16 were analyzed after this continuing calibration.

- During the explosives continuing calibration verification performed on 8/9/07 @2123 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples F51300-7, -8, -9, -10, -11, -12, -13, -14, -15, and -16 were analyzed before this continuing calibration, while samples F51300-17, -18, -25, and -27 were analyzed after this continuing calibration.

- During the explosives continuing calibration verification performed on 8/10/07 @0254 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples F51300-17, -18, -25, and -27 were analyzed before this continuing calibration.

- During the PETN and nitroglycerin initial calibration verification performed on 3/15/07 @1235 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples were analyzed in conjunction with this initial calibration verification.

- During the PETN and nitroglycerin continuing calibration performed on 8/1/07 @1027 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Sample F51300-31 was analyzed after this continuing calibration.

- During the PETN and nitroglycerin continuing calibration performed on 8/1/07 @1136 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Sample F51300-31 was analyzed before this continuing calibration.

- During the PETN and nitroglycerin continuing calibration performed on 8/8/07 @1717 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 51300-19, -20, -21, -22, -23, -24, and -26 were analyzed after this continuing calibration.

- During the PETN and nitroglycerin continuing calibration performed on 8/8/07 @1843 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 51300-19, -20, -21, -22, -23, -24, and -26 were analyzed before this continuing calibration, while samples F51300-27, -28, -29, -30, -1, and -2 were analyzed after this continuing calibration.

- During the PETN and nitroglycerin continuing calibration performed on 8/8/07 @2026 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples F51300-27, -28, -29, -30, -1, and -2 were analyzed before this continuing calibration, while samples F51300-3, -4, -5, -6, -7, -8, -9, -10, -11, and -12 were analyzed after this continuing calibration.

- During the PETN and nitroglycerin continuing calibration performed on 8/8/07 @2209 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples F51300-3, -4, -5, -6, -7, -8, -9, -10, -11, and -12 were analyzed before this continuing calibration, while samples F51300-13, -14, -15, -16, -17, -18, -25, and -27 were analyzed after this continuing calibration.

- During the PETN and nitroglycerin continuing calibration performed on 8/8/07 @2352 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples F51300-13, -14, -15, -16, -17, -18, -25, and -27 were analyzed before this continuing calibration.

V-System Monitoring Compound (Surrogates)

Laboratory performance on individual samples is established by means of spiking activities. The percent recovery (%R) for all samples and blanks must be within the laboratory control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Solid Criteria: 3,4-dinitrotoluene (72-145%)

Aqueous Criteria: 3,4-dinitrotoluene (70-136%)

- Sample F51300-21 had high recoveries from both signals during explosives (202.54%, 202.18%), and PETN & nitroglycerin (211.59%, 217.05%) analyses. The lab reported that they suspected a double spike of the surrogate. No target compounds were detected in F51300-21, no data qualification was required.

- All other samples met surrogate recovery criteria during explosives, PETN, and nitroglycerin analyses. No qualifiers were applied.

VI-Laboratory Control Sample

Laboratory control samples (LCS) are used to monitor long-term accuracy of the analytical method. The analysis is performed at a frequency of 1 per analytical batch. The percent recoveries (%Rs) must be within the laboratory control limits. DoD QSM solid matrix LCS recovery limits are specified in Table D-13 of the DoD QSM (DoD, 2006), while the aqueous LCS recovery limits are specified in Table D-12 of the DoD QSM. If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP21682-BS was used as the aqueous LCS for explosives, PETN, and nitroglycerin analysis. All compounds met recovery criteria. Sample F51300-31 was analyzed in conjunction with this LCS.

- Sample OP21778-BS was used as the solid LCS for explosives, PETN, and nitroglycerin analysis. All compounds met recovery criteria. Samples F51300-1, -2, -3, -4, -5, -6, -7, -8, -9, -10, -11, -12, -13, -14, -15, -16, -17, -18, -25, and -27 were analyzed in conjunction with this LCS.

- Sample OP21779-BS was used as the solid LCS for explosives, PETN, and nitroglycerin analysis. All compounds met recovery criteria. Samples F51300-19, -20, -21, -22, -23, -24, -26, -27, -28, -29, and -30 were analyzed in conjunction with this LCS.

VII-Matrix Spike/Matrix Spike Duplicate

Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the laboratory control limits. DoD MS/MSD recovery limits follow the LCS criteria specified in Table D-12 (aqueous) and D-13 (solid matrix) of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample F51300-31 was used as the aqueous MS/MSD during PETN & nitroglycerine analysis. All compounds met criteria. Sample F51300-31 was analyzed in conjunction with this MS/MSD.

- Sample F51300-27 was used as a solid MS/MSD during PETN & nitroglycerine analysis. All compounds met criteria. Sample F51300-27 was analyzed in conjunction with this MS/MSD.

- Sample F51300-29 was used as a solid MS/MSD during explosives analysis. p-Nitrotoluene (126%) had a high recovery, but no p-nitrotoluene was detected in any samples. All other compounds met criteria. Samples F51300-19, -20, -21, -22, -23, -24, -26, -28, -29, and -30 were analyzed in conjunction with this MS/MSD.

- Sample F51300-25 was used as a solid MS/MSD during explosives analysis. All compounds met criteria. Samples F51300-1 thru -18 and -25 were analyzed in conjunction with this MS/MSD.

VIII-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field duplicate pairs in this data package included 59SB04C (F51300-9) & TMSB04C (F51300-10), 59SB02B (F51300-12) & TMSB02B (F51300-13), and 43SB10B (F51300-28) & TMSB10B (F51300-30). All compounds detected above the reporting limit (RL) met RPD criteria.

IX-Quantitation Verification
The accuracy of analytical results was verified through the calculation of several parameters. The calculation was based calibration factors. The absolute percent difference (%D) between the calculated and the reported value must be within 10% difference. All values >MDL and <MRL or <3*MDL (whichever was greater) were qualified as estimated "J".

Sample: OP21778-BS, HMX

Conc. µg/kg = (Ax * Vt * DF) / (CF * Vi * Ws * Ps * 1000)

where: Ax = Area response for the compound being measured
Vt = Total volume of extract, taking into account dilutions (uL)
DF = Dilution factor
CF = Calibration Factor from initial calibration (area/pg)
Vi = Volume of extract injected (uL)
Ws = weight of sample (g)
Ps = percent solids/100

Conc. µg/kg = (1696865 * 20000 * 1) / (2764 * 1 * 2 * 1 * 1000)
= 6140 ug/kg

Reported Value = 6140 µg/kg
% Difference = 0.0%, values were within 10% difference

Sample: OP21779-BS2, nitroglycerin

Conc. µg/kg = (Ax * Vt * DF) / (CF * Vi * Ws * Ps * 1000)

where: Ax = Area response for the compound being measured
Vt = Total volume of extract, taking into account dilutions (uL)
DF = Dilution factor
CF = Calibration Factor from initial calibration (area/pg)
Vi = Volume of extract injected (uL)
Ws = weight of sample (g)
Ps = percent solids/100

Conc. µg/kg = (3484549 * 20000 * 1) / (1228 * 1 * 2.0 * 1 * 1000)
= 28400 ug/kg

Reported Value = 28400 µg/kg
% Difference = 0.0%, values were within 10% difference

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Dioxin Furans
SGS Paradigm Analytical Laboratories, Inc. Project G383-585
(Accutest SDG F51300)

DATE: January 8, 2008

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on July 25, 2007. The samples were analyzed for Dioxin and Furan compounds using USEPA SW-846 Method 8290 High Resolution Gas Chromatography/High Resolution Mass Spectroscopy (HRGC/HRMS). A total of 1 aqueous and 17 soil samples were validated, as follows:

Field Sample ID	Lab Sample ID	**Field Sample ID**	Lab Sample ID
59SB06A	F51300-1	TMSB04C	F51300-10
59SB06B	F51300-2	59SB02A	F51300-11
59SB06C	F51300-3	59SB02B	F51300-12
59SB05A	F51300-4	TMSB02B	F51300-13
59SB05B	F51300-5	59SB02C	F51300-14
59SB05C	F51300-6	43SB08A	F51300-21
59SB04A	F51300-7	43SB08B	F51300-22
59SB04B	F51300-8	43SB08C	F51300-23
59SB04C	F51300-9	072507R	F51300-31

Data were reviewed and validated using a combination of project QAPP, *DOD Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *USEPA Region III Dioxin/Furan Data Validation Guidance* (March, 1999). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
X		Blank Analysis
	X	Instrument Performance Check
	X	Initial Calibration
	X	Continuing Calibration
	X	Internal Standards (IS) Recovery Standard Solutions
	X	Cleanup Standards
	X	Laboratory Control Standard or Ongoing Precision Result (OPR)
	X	Matrix Spike and Spike Duplicate
X		Field Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Richard M. Cracken

RFAAP VALIDATION REPORT
DIOXIN FURAN REVIEW
SDG G383-587
(Accutest SDG F51300)

I-Holding Times and Preservation

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Dioxin and furan samples must be shipped @4°C ± 2°C, with a maximum holding time of 30 days from sample collection to preparative extraction and 45 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 7/25/07 were sent in five coolers, and were received by the laboratory on 7/26/07 at temperatures ranging from 2.6 °C to 4.0 °C. No qualifiers were applied. Accutest shipped the dioxin aliquots to SGS Paradigm Analytical Laboratories on 7/27/07, and they were received by SGS Paradigm on 7/31/07 at 4.6°C. No qualifiers were applied.

- Holding Time Review: The samples were collected on 7/25/07; the water sample was extracted on 8/1/07; the soil samples were extracted on 8/5/07, 8/7/07, & 8/13/07; the water sample was analyzed on 8/3/07; and the soil samples were analyzed on 8/8/07, 8/9/07, 8/10/07, & 8/20/07. All criteria were met. No qualifiers were applied.

II-Blank Analysis

The purpose of laboratory (or field) blank analyses is to determine the existence and magnitude of contamination problems resulting from field and laboratory activities. No contamination should be found in any of the blanks >EDL (estimated detection limit). The DoD QSM criteria specifies all concentrations should be less than ½ MRL (<MRL for common laboratory contaminants OCDD and OCDF) and <2EDL for the calibration blanks. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants OCDD or OCDF, or 5 times (5X) the maximum amount for other target compounds. **Table 2** summarizes the blank contamination.

Table 2 Blank Contamination Analysis Summary

F51300-31 and F51353-8 are rinsate blanks
J = Estimated value <MRL and >EDL.

III-Instrument Performance Check
Instrument must be tuned with perfluorokerosene (PFK) to achieve a static resolving power of at least 10,000 (10% valley) and lock-mass ion between lowest and highest masses for each descriptor and level of reference compound ≤10%. Documentation of the mass spectrometer resolving power is accomplished by recording the peak profile of the high-mass reference signal (typically m/z 330.9792) obtained during a peak examination by using the low-mass PFK ion at m/z 292.9825 or lower in mass as reference. At the beginning of the each 12-hour period, the chromatographic resolution is verified in the same fashion as in the initial calibration through the analysis of HRCC solution on the DB-5 (or equivalent) column or through the analysis of the column performance solution on the SP-2331 or SP-225 (or equivalent) column. A 25% valley must be achieved between the close eluters.

- All PFK forms were verified and found to be in compliance with method specification. No qualifiers were applied.

IV-Initial Calibration
Once the window defining mix has been analyzed and the descriptor switching times have been verified, the five point calibration solutions can be analyzed prior to sample analysis. Per method and DoD QSM, the initial calibration criteria are as follows:

  - The percent relative standard deviations for the mean response factors RRF(n) from the 17 unlabeled standards must not exceed ±20%, and those for the labeled reference compounds must not exceed ±30%;
  - The signal to noise ratio ≥10% for all target ions;
  - Ion abundance ratios must be within the specified control limits in Table 8 (SW846 Method 8290).

- During initial calibration performed on 07/10/07 using instrument HRMS1, all compounds met criteria. No qualifiers were applied. Sample F51300-2, -3, was analyzed in conjunction with this initial calibration.

- During initial calibration performed on 11/2/06 using instrument HRMS3, all compounds met criteria. No qualifiers were applied. Samples F51300-1, -4 thru -14, and -21 thru -23 were analyzed in conjunction with this initial calibration.

V-Continuing Calibration
The continuing calibration consists of two parts: evaluation of the mass resolution and retention time check. Per method and DoD QSM, the following stipulates the continuing calibration criteria.

  - The signal signal-to-noise ratio (S/N) must be at least 10:1 for each selected ion current profile (SICP) and for each GC signal representing the elution of a target analyte or labeled standard for each analyte.
  - The relative response factor of each analyte for the unlabeled standard must be within ±20% of the average RF obtained from the initial calibration, and the RRF of each labeled standard must be within ±30% of the average RRF established during initial calibration. This is expressed in term of percent difference %D.
  - Ion abundance ratios must be within the specified control limits in Table 8 (SW846 Method 8290).

- During the continuing calibration performed on 8/2/07 @1603 on instrument HRMS1, all criteria were met. No qualifiers were applied. Sample F51300-31 was analyzed after this continuing calibration.

- During the continuing calibration performed on 8/3/07 @0324 on instrument HRMS1, all criteria were met. No qualifiers were applied. Sample F51300-31 was analyzed before this continuing calibration.

- During the continuing calibration performed on 8/8/07 @0947 on instrument HRMS3, 13C-1,2,3,4-TCDD (38.9%) and 13C-1,2,3,7,8,9-HxCDD (35.8%) had high %D. These labeled standards are injection standards only, the standards used for quantitation met criteria, so no data qualifiers were applied. All other standards met criteria. No field samples were analyzed after this continuing calibration.

- During the continuing calibration performed on 8/8/07 @1436 on instrument HRMS3, 13C-1,2,3,4-TCDD (46.8%) and 13C-1,2,3,7,8,9-HxCDD (47.6%) had high %D. These labeled standards are injection standards only, the standards used for quantitation met criteria, so no data qualifiers were applied. All other standards met criteria. Samples F51300-1, -4, -5, -6, -7, -8, were analyzed after this continuing calibration.

- During the continuing calibration performed on 8/9/07 @0159 on instrument HRMS3, 13C-1,2,3,4-TCDD (46.6 %) and 13C-1,2,3,7,8,9-HxCDD (48.0%) had high %D. These labeled standards are injection standards only, the standards used for quantitation met criteria, so no data qualifiers were applied. All other standards met criteria. Samples F51300-1, -4, -5, -6, -7, -8, were analyzed before this continuing calibration, while samples F51300-9 and -10 were analyzed after this continuing calibration.

- During the continuing calibration performed on 8/9/07 @1323 on instrument HRMS3, all criteria were met. No qualifiers were applied. Samples F51300-9 and -10 were analyzed before this continuing calibration.

- During the continuing calibration performed on 8/9/07 @2234 on instrument HRMS3, 13C-1,2,3,4-TCDD (37.2%) and 13C-1,2,3,7,8,9-HxCDD (36.4%) had high %D. These labeled standards are injection standards only, the standards used for quantitation met criteria, so no data qualifiers were applied. All other standards met criteria. Samples F51300-11 thru -17 were analyzed after this continuing calibration.

- During the continuing calibration performed on 8/10/07 @0555 on instrument HRMS3, 13C-1,2,3,4-TCDD (36.6%) and 13C-1,2,3,7,8,9-HxCDD (31.0%) had high %D. These labeled standards are injection standards only, the standards used for quantitation met criteria, so no data qualifiers were applied. All other standards met criteria. Samples F51300-11 thru -17 were analyzed before this continuing calibration.

- During the continuing calibration performed on 8/20/07 @0949 on instrument HRMS1, all criteria were met. No qualifiers were applied. Samples F51300-2 and -3 were analyzed after this continuing calibration.

- During the continuing calibration performed on 8/20/07 @2111 on instrument HRMS1, all criteria were met. No qualifiers were applied. Samples F51300-2 and -3 were analyzed before this continuing calibration.

VI-Internal Standards (IS) Recovery Standard Solutions

Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Specific criteria include: Recoveries of the isotopically-labeled recovery standards to fall within the 40 to 135 percent range for the tetra- through octachlorinated congeners, or as stated in the data package (DoD QSM limits 40-135%).

- All field samples met criteria. No qualifiers were applied.

VII-Cleanup Standards
Cleanup standards are added to every sample, blank, quality control sample, and calibration solution. This compound is added to the samples after extraction but prior to cleanup and is used to verify the percent recovery obtained using the isotope dilution technique. The control limits are 40 to 135 percent (DoD QSM limits 40-135%).

- All field samples met criteria. No qualifiers were applied.

VIII-Laboratory Control Standard (LCS) or Ongoing Precision Result (OPR)
LCSs are used to monitor laboratory accuracy and precision by calculating the percent recoveries of the spiked compounds. Per DOD QSM and method criteria, acceptable performance is determined by:

1. Recoveries of the isotopically-labeled extraction standards to fall within 40-135% control limits for the tetra- through octachlorinated congeners, or as stated in the data package;

2. Recoveries (accuracy) of the unlabeled compounds should be within $\pm$35% when spiked at the method quantitation limit and within $\pm$30% when spiked above 20 times the method quantitation limit, or as stated in the data package;

3. When duplicate OPR are required, the relative percent difference (RPD) of the unlabeled analytes concentrations should be within 30% when spiked at the method quantitation limit and within $\pm$20% when spiked above 20 times the method quantitation limit.

- Sample OPR14393 was used as the aqueous LCS/LCSD during the 8/2/07 analytical run. All criteria were met. No qualifiers were applied. Sample F51300-31 was were analyzed in conjunction with this LCS.

- Sample OPR14398 was used as the solid LCS/LCSD during the 8/8/07 analytical run. All criteria were met. No qualifiers were applied. Samples F51300-1, -4 thru -14, and -21 thru -23 were analyzed in conjunction with this LCS.

- Sample OPR14402 was used as the solid LCS/LCSD during the 8/9/07 analytical run. All criteria were met. No qualifiers were applied. Samples F51300-1, -4 thru -14, and -21 thru -23 were analyzed in conjunction with this LCS.

- Sample OPR14410 was used as the solid LCS/LCSD during the 8/16/07 analytical run. All criteria were met. No qualifiers were applied. Samples F51300-2 and -3 were analyzed in conjunction with this LCS.

IX-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. Per DoD QSM, MS/MSD recoveries must be within in-house laboratory limits (75-125%) and RPD $\leq$20%.

- MS/MSD analysis was not performed on an RFAAP sample. No data qualification was required.

X-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field duplicate pairs in this data package included F51300-9 & F51300-10, and F51300-12 & F51300-13. Analytes with high RPDs included OCDD (83%) in duplicate pair F51300-9/10; and 1,2,3,4,6,7,8-HpCDD (119%), OCDD (133%), 1,2,3,4,6,7,8-HpCDF (54%), and OCDF (85%). All results for these four compounds have been qualified "J/UJ".

XI-Quantitation Verification
The accuracy of analytical results was verified through the calculation of at least one the several parameters such as the %D, %RSD, % recovery, and/or compound concentration. Values were found to be within 10%. Any value reported by the laboratory as estimated "A" based on an analyte to internal standard ratio below the calibration curve was qualified as estimated "J". The signal signal-to-noise ratio (S/N) must be greater than 2.5 for each selected ion current profile (SICP) and for each GC signal representing the elution of a target analyte or labeled standard. Any detected value with ether interference (I-lab flag) was qualified as estimated "J". When the ion ratio failed the 25% criteria (*-lab flag), the estimated maximum possible concentration (EMPC) was reported and flagged estimated "J". If of quantitation interference was present (Q-lab flag), the date was flagged estimated "J" for detects and "UJ" for non-detects.

- The 2,3,7,8-TCDF, 1,2,3,4,6,7,8-HpCDF, and OCDF results in F51300-1 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit.

- The 1,2,3,4,6,7,8-HpCDF result in F51300-2 has been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit, while the OCDD result has been qualified "J" as estimated because the detected amount exceeded the Upper Calibration Limit.

- The 1,2,3,4,6,7,8-HpCDF result in F51300-3 has been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The lab reported 1,2,3,4,7,8,9-HpCDF as an EMPC, but with a EMPC of 0.00 pg/g – the result should therefore be used as a non-detect (ND) at an EDL of 1.22 pg/g.

- The 1,2,3,4,7,8-HxCDD, 1,2,3,6,7,8-HxCDD, 1,2,3,7,8,9-HxCDD, 1,2,3,4,7,8-HxCDF, 1,2,3,6,7,8-HxCDF, 1,2,3,4,6,7,8-HpCDF, and OCDF results in F51300-4 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The ion abundance ratios for 1,2,3,4,7,8-HxCDD, 1,2,3,7,8,9-HxCDD, and 1,2,3,4,7,8-HxCDF did not meet criteria and have been reported as an Estimated Maximum Possible Concentration (EPMC). Since the results have already been qualified "J", no further qualification is required. The OCDD result has been qualified "J" as estimated because the detected amount exceeded the Upper Calibration Limit.

- The 2,3,7,8-TCDF, 1,2,3,4,7,8-HxCDF, and 1,2,3,4,6,7,8-HpCDF results in F51300-5 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The ion abundance ratio for 2,3,7,8-TCDF did not meet criteria and has been reported as an Estimated Maximum Possible Concentration (EPMC). Since the result has already been qualified "J", no further qualification is required.

- The 2,3,7,8-TCDF and OCDF results in F51300-6 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The ion abundance ratio for 2,3,7,8-TCDF did not meet criteria and has been reported as an Estimated Maximum Possible Concentration (EPMC). Since the result has already been qualified "J", no further qualification is required.

- The 1,2,3,6,7,8-HxCDD, 1,2,3,7,8,9-HxCDD, 2,3,7,8-TCDF, 1,2,3,4,6,7,8-HpCDF, and OCDF results in F51300-7 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The ion abundance ratio for 1,2,3,7,8,9-HxCDD did not meet criteria and has been reported as an Estimated Maximum Possible Concentration (EPMC). Since the results have already been qualified "J", no further qualification is required. The OCDD result has been qualified "J" as estimated because the detected amount exceeded the Upper Calibration Limit.

- The 1,2,3,7,8,9-HxCDD, 2,3,7,8-TCDF, 1,2,3,4,6,7,8-HpCDF, and OCDF results in F51300-8 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The ion abundance ratios for 1,2,3,7,8,9-HxCDD, 1,2,3,4,6,7,8-HpCDF, and OCDF did not meet criteria and have been reported as an Estimated Maximum Possible Concentration (EPMC). Since the results have already been qualified "J", no further qualification is required.

- The 2,3,7,8-TCDD, 1,2,3,4,6,7,8-HpCDD, 2,3,7,8-TCDF, 1,2,3,7,8-PeCDF, 1,2,3,4,7,8-HxCDF, 1,2,3,6,7,8-HxCDF, and 1,2,3,4,6,7,8-HpCDF results in F51300-9 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The ion abundance ratios for 2,3,7,8-TCDD, 2,3,7,8-TCDF, 1,2,3,7,8-PeCDF, and 1,2,3,4,7,8-HxCDF did not meet criteria and have been reported as an Estimated Maximum Possible Concentration (EPMC). Since the results have already been qualified "J", no further qualification is required.

- The 1,2,3,4,6,7,8-HpCDD, 2,3,7,8-TCDF, 2,3,4,7,8-PeCDF, 1,2,3,4,7,8-HxCDF, 1,2,3,4,6,7,8-HpCDF, OCDF results in F51300-10 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The ion abundance ratios for 1,2,3,4,6,7,8-HpCDD, 2,3,4,7,8-PeCDF, 1,2,3,4,7,8-HxCDF, 1,2,3,4,6,7,8-HpCDF did not meet criteria and have been reported as an Estimated Maximum Possible Concentration (EPMC). Since the results have already been qualified "J", no further qualification is required.

- The 1,2,3,7,8-PeCDD, 1,2,3,4,7,8-HxCDD, 1,2,3,6,7,8-HxCDD, 1,2,3,7,8,9-HxCDD, 2,3,7,8-TCDF, 1,2,3,7,8-PeCDF, 2,3,4,7,8-PeCDF, 1,2,3,4,7,8-HxCDF, 1,2,3,6,7,8-HxCDF, 2,3,4,6,7,8-HxCDF, 1,2,3,7,8,9-HxCDF, 1,2,3,4,6,7,8-HpCDF, 1,2,3,4,7,8,9-HpCDF, and OCDF results in F51300-11 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The ion abundance ratios for 1,2,3,7,8-PeCDD, 1,2,3,4,7,8-HxCDD, 1,2,3,6,7,8-HxCDD, 2,3,7,8-TCDF, and 1,2,3,7,8-PeCDF did not meet criteria and have been reported as an Estimated Maximum Possible Concentration (EPMC). Since the results have already been qualified "J", no further qualification is required.

- The 2,3,7,8-TCDF, 1,2,3,4,7,8-HxCDF, 1,2,3,4,6,7,8-HpCDF, and OCDF results in F51300-12 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The ion abundance ratio for 2,3,7,8-TCDF did not meet criteria and has been reported as an Estimated Maximum Possible Concentration (EPMC). Since the result has already been qualified "J", no further qualification is required.

- The 1,2,3,7,8,9-HxCDD, 1,2,3,4,7,8-HxCDF, 1,2,3,4,6,7,8-HpCDF, and OCDF results in F51300-13 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The OCDD result has been qualified "J" as estimated because the detected amount exceeded the Upper Calibration Limit.

- The 1,2,3,6,7,8-HxCDD, 1,2,3,4,7,8-HxCDF, 1,2,3,4,6,7,8-HpCDF, and OCDF results in F51300-14 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The ion abundance ratio for 1,2,3,6,7,8-HxCDD did not meet criteria and has been reported as an Estimated Maximum Possible Concentration (EPMC). Since the result has already been qualified "J", no further qualification is required.

- The 1,2,3,7,8-PeCDD, 1,2,3,4,7,8-HxCDD, 1,2,3,6,7,8-HxCDD, 1,2,3,7,8,9-HxCDD, 2,3,7,8-TCDF, 1,2,3,7,8-PeCDF, 2,3,4,7,8-PeCDF, 1,2,3,4,7,8-HxCDF, 1,2,3,6,7,8-HxCDF, 2,3,4,6,7,8-HxCDF, and 1,2,3,4,7,8,9-HpCDF results in F51300-21 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The ion abundance ratios for 1,2,3,7,8-PeCDD, 1,2,3,4,7,8-HxCDD, and 1,2,3,4,7,8,9-HpCDF did not meet criteria and have been reported as an Estimated Maximum Possible Concentration (EPMC). Since the results have already been qualified "J", no further qualification is required.

- The 2,3,7,8-TCDD, 1,2,3,7,8-PeCDD, 1,2,3,4,7,8-HxCDD, 1,2,3,6,7,8-HxCDD, 1,2,3,7,8,9-HxCDD, 1,2,3,7,8-PeCDF, 2,3,4,7,8-PeCDF, 1,2,3,4,7,8-HxCDF, 1,2,3,6,7,8-HxCDF, 2,3,4,6,7,8-HxCDF, 1,2,3,7,8,9-HxCDF, and 1,2,3,4,6,7,8-HpCDF results in F51300-22 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The ion abundance ratios for 2,3,7,8-TCDD and 1,2,3,7,8-PeCDD did not meet criteria and have been reported as an Estimated Maximum Possible Concentration (EPMC). Since the results have already been qualified "J", no further qualification is required.

- The 1,2,3,4,6,7,8-HpCDD, 2,3,7,8-TCDF, 1,2,3,7,8-PeCDF, 1,2,3,4,6,7,8-HpCDF, and OCDF results in F51300-23 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The ion abundance ratios for 1,2,3,7,8-PeCDF and OCDF did not meet criteria and have been reported as an Estimated Maximum Possible Concentration (EPMC). Since the results have already been qualified "J", no further qualification is required.

- The 1,2,3,4,6,7,8-HpCDF, and OCDF results in F51300-31 have been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit.

Sample: F51300-3, OCDD

A(x) = sum of the integrated ion abundances of the quantitation ions for the unlabeled ions;
A(is) = sum of the integrated ion abundances of the quantitation ions for the labeled ions;
Q(is) = quantity, in ng/ul, of the internal standard added to the sample before extraction;
Avg. RRF = calculated mean relative response factor for the unlabeled analyte.
Ws = weight of sample (g)
Ps = percent solids/100

$$\text{Conc. (ng/L)} = \frac{(A(x)) * Q(is) * 1000}{A(is) * \text{Avg. RRF} * Ws * Ps} = \frac{(232000000) * 4.0 * 1000}{(41200000) * 1.0783 * 11.94 * 0.824} = 2120 \text{ pg/g}$$

Reported Value = 2120 pg/g
% Difference = 0.0%
Values were within 10% difference

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ EDL and <MRL or <3*EDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥EDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ EDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I RFAAP Project Manager

FROM: Richard McCracken, Shaw E&I RFAAP Project Chemist

SUBJECT: Radford Army Ammunition Plant (RFAAP) Data Validation – Herbicides
Accutest Laboratories, Inc., SDG F51300

DATE: December 28, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on July 25, 2007. The samples were analyzed for chlorinated herbicides using USEPA SW846 Method 8151A. A total of 1 aqueous and 30 soil samples were validated. The sample IDs are:

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times
X		Initial Calibration
	X	Continuing Calibration
	X	Blank Analysis
	X	System Monitoring Compounds
	X	Laboratory Control Sample
X		Matrix Spike/Spike Duplicate
	X	Field Duplicate
	X	Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Richard McCracken, Chemist

RFAAP VALIDATION REPORT
CHLORINATED HERBICIDES REVIEW
SDG F51300

I-Holding Times

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Solid samples must be cooled @4°C ± 2°C, with a maximum holding time of 14 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis. Aqueous samples must be cooled @4°C ± 2°C, with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 7/25/07 were sent in five coolers, and were received by the laboratory on 7/26/07 at temperatures ranging from 2.6 °C to 4.0 °C. No qualifiers were applied.

- Holding Time Review: The samples were collected on 7/25/07; extracted on 7/31/07 (water & soils) & 8/2/07 (soils only); and analyzed on 8/2/07, 8/3/07, 8/4/07, & 8/6/07. All criteria were met. No qualifiers were applied.

II-Initial Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The DoD QSM specifies that the percent relative standard deviation (%RSD) for a 5-point standard calibration should be ≤20% for each target compound.

- No initial calibration data was provided for MCPP or MCPA. During discussions with the laboratory, they indicated that they perform a one-point calibration each day that analysis for MCPP or MCPA is conducted. A five-point initial calibration was not performed, therefore all data for these two compounds has been qualified "J/UJ".

- During the initial calibration performed on 8/1/07 on instrument GC-GG, pentachlorophenol (20.65%) and 2,4,5-TP (Silvex) (20.32%) had %RSD > 20% on signal #1 - the results for these two compounds have been qualified "J/UJ". The other target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. All samples were analyzed following this initial calibration.

III-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Continuing calibration establishes the response factors on which the quantitations are based and checks satisfactory performance of the instrument on a day-to-day basis. The DoD QSM specifies that the percent difference (%D) between the initial calibration CF and the continuing calibration CF must be ≤20%.

- A one-point daily calibration from 8/2/07 @1149, 8/3/07 @1729, and was provided for MCPP and MCPA, indicating that the lab is able to detect and quantitate both compounds. %D data was not supplied since a five-point initial calibration was not performed. All MCPP and MCPA data has already been qualified (see initial calibration), no additional qualification is required.

- During continuing calibration performed on 8/2/07 @1244 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. Samples F51300-1, -2, -3, -4, and -5 were analyzed after this continuing calibration.

- During continuing calibration performed on 8/2/07 @2009 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. Samples F51300-1, -2, -3, -4, and -5 were analyzed before this continuing calibration, while samples F51300-7, -8, -9, -10, -11, -12, -13, -14, -15, and -16 were analyzed after this continuing calibration.

- During continuing calibration performed on 8/3/07 @0134 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. Samples F51300-7, -8, -9, -10, -11, -12, -13, -14, -15, and -16 were analyzed before this continuing calibration, while sample F51300-25 was analyzed after this continuing calibration.

- During continuing calibration performed on 8/3/07 @0350 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. Sample F51300-25 was analyzed before this continuing calibration, while sample F51300-6 was analyzed after this continuing calibration.

- During continuing calibration performed on 8/3/07 @0805 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. Sample F51300-6 was analyzed before this continuing calibration.

- During continuing calibration performed on 8/3/07 @1756 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. Samples F51300-31 and -17 were analyzed after this continuing calibration.

- During continuing calibration performed on 8/3/07 @2322 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. Sample F51300-31 and -17 were analyzed before this continuing calibration, while samples F51300-18, -22, -23, -28, -29, and -30 were analyzed after this continuing calibration.

- During continuing calibration performed on 8/6/07 @1221 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. Sample F51300-19, -20, -21, -24, -26, and -27 were analyzed after this continuing calibration.

- During continuing calibration performed on 8/6/07 @1722 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. Sample F51300-19, -20, -21, -24, -26, and -27 were analyzed before this continuing calibration.

IV-Blank Analysis

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field or laboratory activities. No contaminants should be detected in any of the associated blanks. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are qualified "B" if the concentration of the analyte is ≤ five times (5x) the absolute maximum blank concentration. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/L or ug/kg	Action Level µg/L	B qualified samples
8/2/07	OP7785-MB	All target compounds <½MRL	NA	NA	None
8/3/07	OP7790-MB	All target compounds <½MRL	NA	NA	None
8/3/07	OP7792-MB	All target compounds <½MRL	NA	NA	None
8/3/07	072507R	All target compounds <½MRL	NA	NA	None
8/3/07	072607R	All target compounds <½MRL	NA	NA	None

072507R and 072607R are rinsate blanks.
NA = Not applicable. MRL = Method reporting limit.

V-System Monitoring Compounds (Surrogates)
Laboratory performance on individual samples is established by means of spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. Spike recoveries must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Control Limit: 2,4-DCAA (34-179%)

- All samples met recovery criteria.

VI-Laboratory Control Samples
Data for laboratory control samples (LCS) are generated to determine long-term precision and accuracy of the analytical method. Percent recoveries must be within the specified control limits. DoD LCS recovery limits are specified in Tables D-8 (aqueous) and D-9 (solid matrix) of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP7785-BS was used as a solid matrix LCS during the 8/2/07 run. All herbicides were within criteria, no data qualifiers were applied. Samples F51300-1 thru -16 and -25 were analyzed in conjunction with this LCS.

- Sample OP7790-BS was used as a aqueous LCS during the 8/3/07 run. All herbicides were within criteria, no data qualifiers were applied. Sample F51300-31 was analyzed in conjunction with this LCS.

- Sample OP7792-BS was used as a solid matrix LCS during the 8/2/07 run. All herbicides were within criteria, no data qualifiers were applied. Samples F51300-17 thru -24 and -26 thru -30 were analyzed in conjunction with this LCS.

VII-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD MS/MSD recovery limits follow the LCS criteria specified in Tables D-8 (aqueous) and D-9 (solid matrix) of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Solid matrix MS/MSD analysis was performed on F51300-25. Dichloroprop (65%) had a low recovery in the MS – the dichloroprop results in associated samples have been qualified "J/UJ". 2,4,5-TP (Silvex), 2,4,5-T, and dalapon had high RPDs – no data qualification is performed on RPD data alone. All other herbicides met recovery and RPD criteria. Samples F51300-1 thru -16 and -25 were analyzed in conjunction with this MS/MSD.

- Aqueous MS/MSD analysis was performed on F51275-1 (an RFAAP sample analyzed in Accutest project F51275). Dinoseb (13%, 14%) had a low recovery in the MS & MSD, the dinoseb results in associated samples have been qualified "J/UJ". All other herbicides met recovery and RPD criteria. Sample F51300-31 was analyzed in conjunction with this LCS.

- Solid matrix MS/MSD analysis was performed on F51300-29. 2,4,5-TP (Silvex) (30%), 2,4,5-T (35%), dinoseb (0%, 0%), dalapon (0%, 0%), dichloroprop (49%), and 2,4-DB (44%) had low recoveries in the MS or both the MS & MSD – the results for these compounds in associated samples have been qualified "J/UJ". 2,4-D, 2,4,5-TP (Silvex), 2,4,5-T, dicamba, dichloroprop, and 2,4-DB had high RPDs – no data qualification is performed on RPD data alone. All other herbicides met recovery and RPD criteria. Samples F51300-17 thru -24 and -26 thru -30 were analyzed in conjunction with this MS/MSD.

VIII-Field Duplicate Sample Analysis

Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were qualified because of blank contamination (B-qualified) or were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field duplicate pairs in this data package included 59SB04C (F51300-9) & TMSB04C (F51300-10), 59SB02B (F51300-12) & TMSB02B (F51300-13), and 43SB10B (F51300-28) & TMSB10B (F51300-30). All compounds detected above the reporting limit (RL) met RPD criteria.

IX-Quantitation Verification

The accuracy of analytical results is verified through the calculation of several parameters. Percent difference (%D) between the calculated value and the reported value must be within 10%. All positive values must have less than or equal to 40% %D between the primary and secondary columns. Any sample value >MDL and <MRL is qualified as estimated, "J." All criteria were met. No qualifiers were applied.

- The %D between the primary and secondary columns was within criteria for all detected chlorinated herbicides.

Sample: OP7785-BS, 2,4-D

Conc. µg/kg = (Ax * Vt * DF) / (CF * Vi * Ws * Ps * 1000)

where:
- Ax = Area response for the compound being measured
- Vt = Total volume of extract, taking into account dilutions (uL)
- DF = Dilution factor
- CF = Calibration Factor from initial calibration (area/pg)
- Vi = Volume of extract injected (uL)
- Ws = weight of sample (g)
- Ps = percent solids/100

Conc. µg/kg = (1643574 * 10000 * 1) / (9670 * 1 * 30.11 * 1 * 1000)
= 56.5 ug/kg

Reported Conc. = 56.6 µg/kg
%D = 0.2%
Values were within 10% difference

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

A (Dioxins) = MDL is based upon the signal-to-noise measurement.

B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics and Dioxins) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

D (Organics) = Indicates sample was analyzed at a dilution.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

E (Dioxins) = Reported value is estimated because of the presence of ether interferences.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/F ions is outside accepted ranges. The detected PCDD/F is reported as an estimated maximum possible concentration (EMPC).

I (Dioxins) = Reported value is estimated because of the incorrect isotope rations were obtained.

J (All) = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, (2) estimating a concentration <MRL and ≥ MDL, or estimating a concentration below the calibration range.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

U (All) = ND = BQL = Not detected. The associated number indicates the compound reporting limit for the sample.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

CAS No.	Surrogate Recoveries	Run# 1	Run# 2	Limits
19719-28-9	2,4-DCAA	116%		34-179%

(a) Analysis performed at Accutest Laboratories, Houston, TX.

ND = Not detected MDL - Method Detection Limit
RL = Reporting Limit
E = Indicates value exceeds calibration range
J = Indicates an estimated value
B = Indicates analyte found in associated method blank
N = Indicates presumptive evidence of a compound

Shaw® Shaw Environmental, Inc.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – TAL Metals
Accutest Laboratories, Inc., SDG F51300

DATE: January 2, 2008

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on July 25, 2007. The samples were analyzed for target analyte list (TAL) metals using USEPA SW-846 3010A/6010B (aqueous) and 3050B/6010B (solid matrix) for ICP metals; and SW-846 7470A (aqueous) and 7471A (solid matrix) for mercury. A total of 1 aqueous and 30 soil samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	**Field Sample ID**	Lab Sample ID

43SB06A	F51300-15	072507R	F51300-31
43SB06B	F51300-16		

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Inorganic Data Review* (April, 1993). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times
X		Initial and Continuing Calibration
X		Blank Analysis
	X	ICP Interference Check Sample (ICS)
	X	Laboratory Control Sample (LCS)
X		Laboratory Sample Duplicate
X		Matrix Spike and Spike Duplicate
X		ICP Serial Dilution
	X	Field Sample Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Richard McCracken, Chemist

RFAAP VALIDATION REPORT
METALS REVIEW
SDG F51300

I-Holding Times

The primary objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample analysis. Holding time criteria: Solid samples must be cooled @4°C±2°C with a maximum holding time of 180 days for ICP metals and 28 days for mercury. Aqueous samples must be preserved to pH<2 with HNO_3 and cooled @4°C±2°C, with a maximum holding time of 180 days for ICP metals and 28 days for mercury.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 7/25/07 were sent in five coolers, and were received by the laboratory on 7/26/07 at temperatures ranging from 2.6 °C to 4.0 °C. No qualifiers were applied.

- Holding Time Review: The samples were collected 7/25/07 for metals analysis, digested for mercury on 7/27/07 and 7/28/07, analyzed for mercury on 7/27/07 and 7/28/07, digested for ICP metals on 7/27/07 and 7/30/07, and analyzed for ICP metals on 7/28/07, 7/30/07, & 7/31/07. All criteria were met. No qualifiers were applied.

II-Initial and Continuing Calibration

Requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable quantitative data. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of the analysis run, and continuing calibration verification documents that the initial calibration is still valid.

ICP:	1- blank (DoD QSM <½ MRL) 3 – standards (r≥0.995) ICV/CCV (90-110%) (DoD QSM 90-110%) MRL (70-130%) (DoD QSM 80-120%) High Std. (95-105%)	Hg:	1 – blank (DoD QSM <½ MRL) 5 – standards (r≥0.995) ICV/CCV (80-120%)(DoD QSM ICV 90-110% & CCV 80-120%) MRL (80-120%) (DoD QSM 80-120%) High Std. (95-105%)

- Mercury analysis was performed on 7/27/07, with a correlation coefficient of 0.999.

- Mercury analysis was performed on 7/28/07, with a correlation coefficient of 0.999.

- The mercury ICVs and CCVs met recovery criteria.

- Sample F51300-31 was analyzed for ICP metals on 7/28/07 between CCV21 and CCV22. Both CCVs met recovery criteria.

- Samples F51300-1 thru -30 were analyzed for ICP metals between CCV6 and CCV11 during the 7/30/07 metals run. All CCVs in this interval met recovery criteria.

- Selected samples were analyzed for iron and manganese between CCV3 and CCV6 during the 7/31/07 metals run. All CCVs in this interval met recovery criteria.

- All metals met recovery criteria during the High Standard analysis.

- **Table 2** summarizes the MRL standard analysis. Samples with concentrations detected less than two times the MRL with out of criteria MRL recovery were qualified.

Table 2 MRL Analysis Summary

Analysis Date	Analysis	MRL	MRL %Recovery	Qualified samples @ <2xMRL	Validation Qualifiers
7/27/07	Hg	0.2 ug/l	150.0	F51300-17, -23	K
7/28/07	Hg	0.2 ug/l	Met criteria	None	None

7/30/07	ICP-Tl	10 ug/l	125.0	None	None
7/31/07	ICP metals	Various	Met criteria	None	None

III-Blanks

Blanks (preparation and calibration blanks) are assessed to determine the existence and magnitude of contamination problems. No contaminants should be detected (i.e. <MDL) in any of the associated blanks. DoD QSM limits are <½MRL for the method blank and <2*MDL for the calibration blanks. Samples are qualified "B" when they are less than 5x the absolute value of the maximum blank concentration. **Table 3** summarizes the blank contamination analysis.

J = Estimated value <MRL and >MDL.

IV-ICP Interference Check Sample (ICS)
The ICP interference check sample (ICS) verifies interelement and background correction factors. ICP Interference Check is performed at the beginning and end of each sample analysis run. Control limits are 80-120% (DoD QSM limits 80-120%).

- All criteria were met. No qualifiers were applied.

V-Laboratory Control Samples (LCS)
The laboratory control sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. The DoD LCS recovery limits are specified in Tables D-18 (aqueous) and D-19 (solid matrix) of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample MP12593-BS was used as an aqueous LCS during ICP metals analysis. All criteria were met. No qualifiers were applied. Sample F51300-31 was analyzed in conjunction with this LCS.

- Sample MP12608-BS was used as a solid matrix LCS during ICP metals analysis. All criteria were met. No qualifiers were applied. Samples F51300-1 thru -19 and -25 were analyzed in conjunction with this LCS.

- Sample MP12609-BS was used as a solid matrix LCS during ICP metals analysis. All criteria were met. No qualifiers were applied. Samples F51300-20 thru -24, and -26 thru -30 were analyzed in conjunction with this LCS.

- Sample MP12585-BS was used as a solid matrix LCS during mercury analysis. All criteria were met. No qualifiers were applied. Samples F51300-1 thru -12 and -25 were analyzed in conjunction with this LCS.

- Sample MP12586-BS was used as a solid matrix LCS during mercury analysis. All criteria were met. No qualifiers were applied. Samples F51300-13 thru -24 and -26 thru -30 were analyzed in conjunction with this LCS.

- Sample MP12598-BS was used as the LCS during aqueous ICP metals analysis. All criteria were met. No qualifiers were applied. Sample F51300-31 was analyzed in conjunction with this LCS.

VI-Laboratory Duplicate Sample Analysis
Duplicate sample determinations are used to demonstrate acceptable method precision by the laboratory at the time of analysis. Duplicate analyses are also performed to generate data in order to determine the long-term precision of the analytical method on various matrices. RPDs must be within established control limits. DoD QSM limits for metals are 20% RPD for ICP metals and mercury.

- Sample F51300-25 was analyzed in duplicate during solid matrix ICP metals analysis. Antimony (27.8%), arsenic (92.5%), calcium (108.9%), copper (34.1%), iron (48.0%), lead (83.5%), magnesium (65.7%), and zinc (35.4%) had RPDs above criteria – all results for these metals have been qualified "J/UJ". The other metals met RPD criteria. Samples F51300-1 thru -19 and -25 were analyzed in conjunction with this laboratory duplicate.

- Sample F51300-29 was analyzed in duplicate during solid matrix ICP metals analysis. Calcium (21.4%), cobalt (64.0%), lead (21.4%), manganese (67.0%), and selenium (40.0%) had RPDs above criteria – all results for these metals have been qualified "J/UJ". The other metals met RPD criteria. Samples F51300-20 thru -24, and -26 thru -30 were analyzed in conjunction with this laboratory duplicate.

- Sample F51289-13 was analyzed in duplicate during aqueous ICP metals analysis. The sample was not a RFAAP site sample; therefore, it was not evaluated. Sample F51300-31 was analyzed in conjunction with this laboratory duplicate.

- Sample F51300-25 was analyzed in duplicate during solid matrix mercury analysis, and met RPD criteria. Samples F51300-1 thru -12 and -25 were analyzed in conjunction with this laboratory duplicate.

- Sample F51300-29 was analyzed in duplicate during solid matrix mercury analysis, and met RPD criteria. Samples F51300-13 thru -24 and -26 thru -30 were analyzed in conjunction with this laboratory duplicate.

- Sample F51314-1 was analyzed in duplicate during aqueous mercury analysis. The sample was not a RFAAP site sample; therefore, it was not evaluated. Sample F51300-31 was analyzed in conjunction with this laboratory duplicate.

VII-Matrix Spike/Spike Duplicate

MS/MSD are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. Specific criteria include the analyses of matrix spike and matrix spike duplicate samples at a frequency of one MS and MSD per 20 samples of similar matrix. MS and MSD recoveries and relative percent differences between MS and MSD recoveries should be within the specified limits. DoD MS/MSD recovery limits follow the LCS criteria specified in Tables D-18 (aqueous) and D-19 (sold matrix) of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used. Post digestion spikes limits are 75-125% for ICP metals and mercury.

- Sample F51300-25 was used as an MS/MSD during solid matrix ICP metals analysis. Antimony (19.1%, 18.3%), arsenic (55.1%, 58.9%), barium (68.0%, 73.8%), cadmium (69.3%, 71.6%), calcium (0%, 0%), cobalt (69.3%, 75.9%), copper (38.7%, 46.5%), iron (140.4%, 27.5%), lead (48.9%, 60.1%), magnesium (0%, 0%), nickel (69.3%, 77.0%), potassium (72.3%, 77.3%), selenium (56.8%, 60.9%), thallium (67.2%, 70.0%), and zinc (0%, 18.3%) had low recoveries in the MS & MSD, while chromium (70.3%), manganese (0%), silver (73.0%), and sodium (79.4%) had low recoveries in the MS or MSD. The sample concentration was >4 times the spike added for calcium, iron, magnesium, and manganese; therefore, no qualifiers were applied for these four metals. The results for the other metals listed have been qualified "L/UL". The other metals met recovery criteria, and all metals met RPD criteria. Samples F51300-1 thru -19 and -25 were analyzed in conjunction with this MS/MSD.

- Sample F51300-29 was used as an MS/MSD during solid matrix ICP metals analysis. Aluminum (0%, 49.7%), antimony (29.0%, 27.1%), arsenic (69.6%, 71.4%), barium (73.4%, 75.2%), cadmium (74.5%, 73.7%), cobalt (61.3%, 53.3%), lead (76.2%, 78.4%), magnesium (68.4%, 69.1%), manganese (0%, 0%), nickel (74.1%, 77.8%), potassium (71.1%, 77.8%), selenium (66.5%, 68.5%), and thallium (75.8%, 77.4%) had low recoveries in the MS & MSD, while chromium (77.0%), iron (6.4%), vanadium (79.1%), and zinc (78.5%) had low recoveries in the MS or MSD. The sample concentration was >4 times the spike added for aluminum, iron, and manganese; therefore, no qualifiers were applied for these three metals. The results for the other metals listed have been qualified "L/UL". The other metals met recovery criteria, and all metals met RPD criteria. Samples F51300-20 thru -24, and -26 thru -30 were analyzed in conjunction with this MS/MSD.

- Sample F51289-3 was used as an MS/MSD during aqueous ICP metals analysis. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Sample F51300-31 was analyzed in conjunction with this MS/MSD.

- Sample F51300-25 was used as an MS/MSD during solid matrix mercury analysis. Both MS and the MSD (0%, 0%) had low recoveries. The sample concentration was >4 times the spike added; therefore, no qualifiers were applied. Samples F51300-1 thru -12 and -25 were analyzed in conjunction with this laboratory duplicate.

- Sample F51300-29 was used as an MS/MSD during solid matrix mercury analysis, and met the recovery and RPD criteria. Samples F51300-13 thru -24 and -26 thru -30 were analyzed in conjunction with this MS/MSD.

- Sample F51314-1 was used as the MS/MSD during aqueous mercury analysis. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Sample F51300-31 was analyzed in conjunction with this MS/MSD.

VIII-ICP Serial Dilution

An ICP serial dilution is performed to determine whether significant physical or chemical interferences exist due to sample matrix at high concentrations. An analysis of a 5-fold dilution should agree within 10% difference of the original result when the concentration in sample is a factor of 50 above MDL.

- Sample F51300-25 was used as the serial dilution during solid matrix ICP metals analysis. Aluminum (24.4%), barium (25.0%), calcium (32.4%), chromium (29.6%), cobalt (28.2%), copper (13.4%), iron (32.3%), lead (34.2%), magnesium (38.0%), manganese (32.8%), nickel (33.8%), potassium (17.2%), vanadium (28.3%), and zinc (28.6%) had %D > 10%. All detections for these metals have been qualified "J/UJ". The other metals met criteria. Samples F51300-1 thru -19 and -25 were analyzed in conjunction with this serial dilution.

- Sample F51300-29 was used as the serial dilution during solid matrix ICP metals analysis. Aluminum (23.4%), barium (23.9%), calcium (24.5%), chromium (22.8%), cobalt (23.5%), copper (12.1%), iron (27.6%), lead (37.4%), magnesium (35.3%), manganese (27.2%), nickel (26.4%), potassium (21.5%), vanadium (22.5%), and zinc (24.4%) had %D > 10%. All detections for these metals have been qualified "J/UJ". The other metals met criteria. Samples F51300-20 thru -24, and -26 thru -30 were analyzed in conjunction with this serial dilution.

- Sample F51289-3 was used as the serial dilution during aqueous ICP metals analysis. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Sample F51300-31 was analyzed in conjunction with this serial dilution.

- Sample F51300-25 was used as the serial dilution during solid matrix mercury analysis, and met %D criteria. No data qualifiers were applied. Samples F51300-1 thru -12 and -25 were analyzed in conjunction with this laboratory duplicate.

- Sample F51300-29 was used as the serial dilution during solid matrix mercury analysis, and met %D criteria. No data qualifiers were applied. Samples F51300-13 thru -24 and -26 thru -30 were analyzed in conjunction with this laboratory duplicate.

- Sample F51314-1 was used as the serial dilution during aqueous mercury analysis. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Sample F51300-31 was analyzed in conjunction with this serial dilution.

IX-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 35% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field duplicate pairs in this data package included 59SB04C (F51300-9) & TMSB04C (F51300-10), 59SB02B (F51300-12) & TMSB02B (F51300-13), and 43SB10B (F51300-28) & TMSB10B (F51300-30). All compounds detected above the reporting limit (RL) met RPD criteria.

X-Quantitation Verification
The accuracy of analytical results is verified through the calculation of several parameters. The percent difference (%D) between the calculated and the reported values should be within 10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J." The following calculations were performed for verification.

ICP Sample: F51300-13, Chromium

Conc. (mg/kg) = (conc. μg/L) *(Final Volume L) * (DF) / (Sample weight g) * (Percent solids/100)

Conc. (mg/kg) = (275.8 μg/L)*(0.05 L)*(1) / (1.01)*(0.853) = 16.0 mg/kg

Reported concentration = 16.0 mg/kg
%D = 0.0%
Values were within 10% difference.

CVAA Sample: F51300-13, Mercury

Conc. (mg/kg) = (conc. μg/L) *(Final Volume L) * (DF) / (Sample weight g) * (Percent solids/100)

Conc. (mg/kg) = (1.20 μg/L)*(0.05 L)*(1) / (0.69)*(0.853) = 0.10 mg/kg

Reported concentration = 0.10 mg/kg
%D = 0.0%.
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

D = Indicates sample was analyzed at a dilution.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

N (Metals) = Laboratory spike sample recovery not within control limits.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Pesticides and PCBs
Accutest Laboratories, Inc., SDG F51300

DATE: December 21, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on July 25, 2007. Samples were analyzed for pesticides using USEPA Methods 3550B/8081A (soils) and 3510C/8081A (waters); and for PCBs using USEPA Methods 3550B/8082 (soils) and 3510C/8082 (waters), respectively. A total of 1 aqueous and 30 soil samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
59SB06A	F51300-1	43SB06C	F51300-17
59SB06B	F51300-2	43SB07A	F51300-18

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Instrument Performance Check
	X	Initial Calibration
X		Continuing Calibration
	X	Blank Analysis
X		System Monitoring Compounds
X		Laboratory Control Samples
X		Matrix Spike/Spike Duplicate
	X	Field Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

RFAAP VALIDATION REPORT
PESTICIDE/PCB REVIEW
SDG F51300

I-Holding Times and Preservation
The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: Solid samples must be stored @4°C ± 2°C with a maximum holding time of 14 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis. Aqueous samples must be cooled @4°C ± 2°C with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 7/25/07 were sent in five coolers, and were received by the laboratory on 7/26/07 at temperatures ranging from 2.6 °C to 4.0 °C. No qualifiers were applied.

- Holding Time Review: The samples were collected on 7/25/07. The aqueous sample was extracted for pesticides and PCBs on 7/30/07, analyzed for pesticides on 8/10/07, and analyzed for PCBs on 8/1/07. The solid samples were extracted for pesticides and PCBs on 8/2/07 & 8/3/07, analyzed for pesticides on 8/8/07, 8/9/07, 8/10/07, & 8/11/07, and analyzed for PCBs on 8/6/07, 8/7/07, 8/8/07, & 8/13/07. All criteria were met. No qualifiers were applied.

II-Instrument Performance Check (Degradation Standard)
Performance checks on the gas chromatograph with electron capture detector (GC/ECD) system are performed to ensure adequate resolution and instrument sensitivity. The performance evaluation mixture (PEM) must be analyzed at the beginning of the analytical sequence. The breakdown of Endrin and 4,4'-DDT must be ≤15% on both signals.

- During the analysis beginning 8/6/07 @0925, endrin and 4,4'-DDT percent breakdowns were 11.2% and 7.1% on signal #1, and 10.7% and 5.6% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- During the analysis beginning 8/8/07 @1046, endrin and 4,4'-DDT percent breakdowns were 4.6% and 4.2% on signal #1, and 4.6% and 3.1% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- During the analysis beginning 8/9/07 @1538, endrin and 4,4'-DDT percent breakdowns were 3.8% and 3.5% on signal #1, and 4.0% and 2.8% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- During the analysis beginning 8/10/07 @1538, endrin and 4,4'-DDT percent breakdowns were 3.7% and 2.5% on signal #1, and 3.9% and 2.0% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- During the analysis beginning 8/11/07 @1054, endrin and 4,4'-DDT percent breakdowns were 3.4% and 2.3% on signal #1, and 3.5% and 2.1% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- During the analysis beginning 8/13/07 @1116, endrin and 4,4'-DDT percent breakdowns were 2.7% and 1.4% on signal #1, and 2.6% and 1.1% on signal #2, respectively. All criteria were met. No qualifiers were applied.

III-Initial Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. The initial 5 point calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run. Calibration factors are generated for each compound. The DoD QSM specifies that the percent relative standard deviation (%RSD) for all single peak target analytes, and aroclors 1016, 1242, 1254, and 1260 must be <20% or the mean %RSD for all analytes in the standard must be ≤20%. If linear regression is used, the correlation coefficient must be ≥0.990. All detects are qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits.

- During the pesticide initial calibration performed on 8/6/07 on instrument ECD6, all criteria were met. No qualifiers were applied. Samples F51300-1 thru -17 were analyzed following this initial calibration.

- During the pesticide initial calibration performed on 8/9/07 on instrument ECD6, all criteria were met. No qualifiers were applied. Samples F51300-18, -19, -20, -21, -22, -23, -24, -25, -26, -27, -28, -29, and -30 were analyzed following this initial calibration.

- During the pesticide initial calibration performed on 8/10/07 on instrument ECD6, all criteria were met. No qualifiers were applied. Sample F51300-31 analysis plus the reanalyses of samples F51300-9, -10, -11, -12, -13, -14, -15, -16, -17, and -22 were performed following this initial calibration.

- During the PCB initial calibration performed on 7/28/07 on instrument ECD3, all criteria were met. No qualifiers were applied. Sample F51300-31 was analyzed following this initial calibration.

- During the PCB initial calibration performed on 8/6/07 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples F51300-1 thru -17 were analyzed following this initial calibration.

- During the PCB initial calibration performed on 8/7/07 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples F51300-18 thru -30 were analyzed following this initial calibration.

- During the PCB initial calibration performed on 8/13/07 on instrument ECD3, all criteria were met. No qualifiers were applied. The reanalyses of samples F51300-16, -17, and -22 were performed following this initial calibration.

IV-Continuing Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for pesticide/PCB target compounds. Continuing calibration standards containing both target compounds and surrogates are analyzed at the beginning of each 12-hour analytical shift and after every 20 samples. The DoD QSM specifies that the percent difference (%D) or the average %Ds for all analytes in the standard from the calibration should be no greater than ±20%.

- During the pesticide initial calibration verification performed on 8/6/07 @1229 on instrument ECD6, all criteria were met. No qualifiers were applied. No samples were analyzed in conjunction with this ICV.

- During the pesticide continuing calibration performed on 8/8/07 @1131 on instrument ECD6, all criteria were met. No qualifiers were applied. Samples F51300-1, -2, -3, -4, -5 -6, -7, and -8 were analyzed following this continuing calibration.

- During the pesticide continuing calibration performed on 8/8/07 @1153 on instrument ECD6, the 4th chlordane peak (20.4%) from signal #2 had a %D outside criteria, but the average %D of all six chlordane peaks was 7.9% which met criteria. No qualifiers were applied. Samples F51300-1, -2, -3, -4, -5 -6, -7, and -8 were analyzed following this continuing calibration.

- During the pesticide continuing calibration performed on 8/8/07 @1209 on instrument ECD6, all criteria were met. No qualifiers were applied. Samples F51300-1, -2, -3, -4, -5 -6, -7, and -8 were analyzed following this continuing calibration.

- During the pesticide continuing calibration performed on 8/8/07 @1528 on instrument ECD6, all criteria were met. No qualifiers were applied. Samples F51300-1, -2, -3, -4, -5 -6, -7, and -8 were analyzed before this continuing calibration, while samples F51300-9, -10, -11, -12, -13, -14, -15, and -16 were analyzed after this continuing calibration.

- During the pesticide continuing calibration performed on 8/8/07 @1838 on instrument ECD6, endrin aldehyde (21.3%) had a high %D on signal #1, while 4,4'-DDT (28.3%, 25.2%) and methoxychlor (25.6%, 24.4%) had a high %D on both signals. The results for these compounds have been qualified "J/UJ" in associated samples. All other compounds met criteria. Samples F51300-9, -10, -11, -12, -13, -14, -15, and -16 were analyzed before this continuing calibration, while sample F51300-17 was analyzed after this continuing calibration.

- During the pesticide continuing calibration performed on 8/8/07 @1926 on instrument ECD6, heptachlor (24.0%, 23.1%), endrin aldehyde (21.9%, 22.4%), 4,4'-DDT(31.8%, 31.8%), and methoxychlor (31.3%, 32.5%) had a high %D on both signals. The results for these compounds have been qualified "J/UJ" in associated samples. All other compounds met criteria. Sample F51300-17 was analyzed before this continuing calibration.

- During the pesticide initial calibration verification performed on 8/9/07 @1840 on instrument ECD6, all criteria were met. No qualifiers were applied. Samples F51300-18, -19, -20, -21, -22, -23, -24, and -25 were analyzed following this ICV.

- During the pesticide continuing calibration performed on 8/9/07 @2134 on instrument ECD6, 4,4'-DDT(26.7%) and methoxychlor (22.2%) had a high %D on signal #1. The results for these compounds have been qualified "J/UJ" in associated samples. All other compounds met criteria. Samples F51300-18, -19, -20, -21, -22, -23, -24, and -25 were analyzed before this continuing calibration, while samples F51300-26, -27, -28, -29, and -30 were analyzed after this continuing calibration.

- During the pesticide continuing calibration performed on 8/9/07 @2356 on instrument ECD6, methoxychlor (20.6%) had a high %D on signal #1. The methoxychlor results have been qualified "J/UJ" in associated samples. All other compounds met criteria. Samples F51300-26, -27, -28, -29, and -30 were analyzed before this continuing calibration.

- During the pesticide initial calibration verification performed on 8/10/07 @1840 on instrument ECD6, all criteria were met. No qualifiers were applied. No samples were analyzed following this ICV.

- During the pesticide continuing calibration performed on 8/10/07 @2015 on instrument ECD6, all criteria were met. No qualifiers were applied. Sample F51300-31 was analyzed following with this continuing calibration.

- During the pesticide continuing calibration performed on 8/10/07 @2205 on instrument ECD6, all criteria were met. No qualifiers were applied. Sample F51300-31 was analyzed before with this continuing calibration.

- During the pesticide continuing calibration performed on 8/10/07 @2309 on instrument ECD6, all criteria were met. No qualifiers were applied. The reanalyses of samples F51300-9, -10, -11, -12, -13, -14, and -15 were performed after this continuing calibration.

- During the pesticide continuing calibration performed on 8/11/07 @ 0202 on instrument ECD6, all criteria were met. No qualifiers were applied. The reanalyses of samples F51300-9, -10, -11, -12, -13, -14, and -15 were performed before this continuing calibration.

- During the pesticide continuing calibration performed on 8/11/07 @1110 on instrument ECD6, all criteria were met. No qualifiers were applied. The reanalyses of samples F51300-14, 16, and 17 were performed after this continuing calibration.

- During the pesticide continuing calibration performed on 8/11/07 @1132 on instrument ECD6, all criteria were met. No qualifiers were applied. The reanalyses of samples F51300-14, 16, and 17 were performed after this continuing calibration.

- During the pesticide continuing calibration performed on 8/11/07 @1148 on instrument ECD6, all criteria were met. No qualifiers were applied. The reanalyses of samples F51300-14, 16, and 17 were performed after this continuing calibration.

- During the pesticide continuing calibration performed on 8/11/07 @1400 on instrument ECD6, all criteria were met. No qualifiers were applied. The reanalyses of samples F51300-14, 16, and 17 were performed before this continuing calibration, while the reanalysis of F51300-22 was performed after this continuing calibration.

- During the pesticide continuing calibration performed on 8/11/07 @1447 on instrument ECD6, all criteria were met. No qualifiers were applied. The reanalysis of F51300-22 was performed before this continuing calibration.

- During the PCB 1016/1260 initial calibration verification performed on 7/28/07 @1459 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples were analyzed following this initial calibration verification.

- During the PCB 1016/1260 continuing calibration performed on 8/1/07 @1521 on instrument ECD3, all criteria were met. No qualifiers were applied. The aqueous method blank, the aqueous LCS, and the aqueous MS/MSD were analyzed following this continuing calibration.

- During the PCB 1016/1260 continuing calibration performed on 8/1/07 @1833 on instrument ECD3, all criteria were met. No qualifiers were applied. The aqueous method blank, the aqueous LCS, and the aqueous MS/MSD were analyzed before this continuing calibration, while sample F51300-31 was analyzed after this continuing calibration.

- During the PCB 1016/1260 continuing calibration performed on 8/1/07 @2015 on instrument ECD3, all criteria were met. No qualifiers were applied. Sample F51300-31 was analyzed before this continuing calibration.

- During the PCB 1016/1260 initial calibration verification performed on 8/6/07 @1556 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples were analyzed following this initial calibration verification.

- During the PCB 1016/1260 continuing calibration performed on 8/6/07 @1906 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples F51300-1 thru -3 plus a solid method blank, a solid LCS, and a solid MS/MSD were analyzed after this continuing calibration.

- During the PCB 1016/1260 continuing calibration performed on 8/6/07 @2214 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples F51300-1 thru -3 plus a solid method blank, a solid LCS, and a solid MS/MSD were analyzed before this continuing calibration, while samples F51300-4, -5, -6, -7, -8, -9, -10, -11, and -12 were analyzed after this continuing calibration.

- During the PCB 1016/1260 continuing calibration performed on 8/7/07 @0121 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples F51300-4, -5, -6, -7, -8, -9, -10, -11, and -12 were analyzed before this continuing calibration, while samples F51300-13, -14, -15, -16, and -17 were analyzed after this continuing calibration.

- During the PCB 1016/1260 continuing calibration performed on 8/7/07 @0321 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples F51300-13, -14, -15, -16, and -17 were analyzed before this continuing calibration.

- During the PCB 1016/1260 initial calibration verification performed on 8/7/07 @1923 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples F51300-18, -19, -20, -21, -22, -23, -24, and -25 were analyzed following this initial calibration verification.

- During the PCB 1016/1260 continuing calibration performed on 8/7/07 @2231 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples F51300-18, -19, -20, -21, -22, -23, -24, and -25 were analyzed before this continuing calibration, while samples F51300-26, -27, -28, -29, and -30 plus an MS/MSD were analyzed after this continuing calibration.

- During the PCB 1016/1260 continuing calibration performed on 8/8/07 @0155 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples F51300-26, -27, -28, -29, and -30 plus an MS/MSD were analyzed before this continuing calibration.

- During the PCB 1016/1260 initial calibration verification performed on 8/13/07 @1416 on instrument ECD3, all criteria were met. No qualifiers were applied. The reanalyses of samples F51300-16, -17, and -22 were performed following this initial calibration verification.

- During the PCB 1016/1260 continuing calibration performed on 8/13/07 @1719 on instrument ECD3, all criteria were met. No qualifiers were applied. The reanalyses of samples F51300-16, -17, and -22 were performed before this continuing calibration.

V-Blank Analysis

The purpose of laboratory or field blank analyses is to determine the existence and magnitude of contamination problems resulting from laboratory or field activities. One method blank per analytical batch must be run on each instrument used to analyze samples. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤5 times (5X) the maximum amount for pesticide and PCB target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Parameter	Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
Pesticides	8/10/07	OP21657-MB	All target <½MRL	NA	NA	None
Pesticides	8/8/07	OP21716-MB	All target <½MRL	NA	NA	None
Pesticides	8/10/07	OP21716-MB	All target <½MRL	NA	NA	None
Pesticides	8/11/07	OP21716-MB	All target <½MRL	NA	NA	None
Pesticides	8/9/07	OP21730-MB	All target <½MRL	NA	NA	None
Pesticides	8/11/07	OP21730-MB	All target <½MRL	NA	NA	None
Pesticides	8/10/07	072507R	All target <½MRL	NA	NA	None
Pesticides	8/10/07	072607R	All target <½MRL	NA	NA	None
PCBs	8/1/07	OP21658-MB	All target <½MRL	NA	NA	None
PCBs	8/6/07	OP21715-MB	All target <½MRL	NA	NA	None
PCBs	8/13/07	OP21715-MB	All target <½MRL	NA	NA	None
PCBs	8/7/07	OP21731-MB	All target <½MRL	NA	NA	None

PCBs	8/1/07	072507R	All target <½MRL	NA	NA	None
PCBs	8/1/07	072607R	All target <½MRL	NA	NA	None

072507R and 072607R are rinsate blanks.
NA = Not Applicable
MRL = Method Reporting Limit

VI-System Monitoring Compound (Surrogates)

Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Surrogate spikes are added to all samples and blanks to measure their recovery in sample and blank matrices. The percent recoveries (%Rs) must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Criteria:	Pesticides:	Tetrachloro-m-xylene: 42-127% (DoD QSM 25-140%) Decachlorobiphenyl: 27-127% (DoD QSM 30-135%)
	PCBs:	Tetrachloro-m-xylene: 38-127% (DoD QSM Not Listed) Decachlorobiphenyl: 25-137% (DoD QSM 40-135%)
Solid Criteria:	Pesticides:	Tetrachloro-m-xylene: 46-122% (DoD QSM 70-125%) Decachlorobiphenyl: 50-133% (DoD QSM 55-130%)
	PCBs:	Tetrachloro-m-xylene: 44-126% (DoD QSM Not Listed) Decachlorobiphenyl: 39-157% (DoD QSM 60-125%)

- Sample F51300-1 had low tetrachloro-m-xylene recoveries (65.26%, 66.78%) from both signals during pesticide analysis. The pesticide results in F51300-1 have been qualified "J/UJ".
- Sample F51300-16 had low tetrachloro-m-xylene recoveries (61.38%, 61.83%) from both signals during pesticide analysis. The pesticide results in F51300-16 have been qualified "J/UJ".
- Sample F51300-18 had a low tetrachloro-m-xylene recovery (68.79%) from signal #1 during pesticide analysis. No data qualification is required unless two surrogates are outside criteria.
- Sample F51300-19 had low tetrachloro-m-xylene recoveries (56.59%, 54.33%) from both signals during pesticide analysis. The pesticide results in F51300-19 have been qualified "J/UJ".
- Sample F51300-25 had low tetrachloro-m-xylene recoveries (54.02%, 53.34%) from both signals during pesticide analysis. The pesticide results in F51300-25 have been qualified "J/UJ".

- Sample F51300-26 had low tetrachloro-m-xylene recoveries (69.57%, 69.36%) from both signals during pesticide analysis. The pesticide results in F51300-26 have been qualified "J/UJ".

- Sample F51300-27 had low tetrachloro-m-xylene recoveries (68.12%, 67.60%) from both signals during pesticide analysis. The pesticide results in F51300-27 have been qualified "J/UJ".

- Sample F51300-28 had low tetrachloro-m-xylene recoveries (68.09%, 68.42%) from both signals during pesticide analysis. The pesticide results in F51300-28 have been qualified "J/UJ".

- Sample F51300-30 had low tetrachloro-m-xylene recoveries (67.97%, 68.90%) from both signals during pesticide analysis. The pesticide results in F51300-30 have been qualified "J/UJ".

- All other samples met surrogate recovery criteria during pesticide analysis.

- Sample F51300-25 had a low decachlorobiphenyl recovery (47.60%) from signal #1 during PCB analysis. No data qualification is required unless two surrogates are outside criteria.

- All samples met surrogate recovery criteria during PCB analysis.

VII-Laboratory Control Samples

Laboratory control samples (LCS) are used to monitor laboratory accuracy by calculating the percent recoveries of the spiked compounds. All LCS percent recoveries must be within the specified control limits. DoD QSM solid matrix LCS recovery limits are specified in Tables D-15 and D-17 of the DoD QSM (DoD, 2006), while aqueous LCS recovery limits are specified in Tables D-14 and D-16 of the DoD QSM. If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP21657-BS was used as the aqueous LCS during the 8/10/07 pesticide analysis. Endrin aldehyde (15%) had a low recovery, and was not detected in any field samples – the endrin aldehyde results have been qualified "UL" as estimated in associated samples. All other pesticides met recovery criteria. Sample F51300-31 was analyzed in conjunction with this LCS.

- Sample OP21716-BS was used as the solid LCS during the 8/8/07 pesticide analysis. Delta-BHC (53%) and endrin aldehyde (12%) had low recoveries, and were not detected in any field samples. The results for both compounds have been qualified "UL" as estimated in associated samples. All other pesticides met recovery criteria. Samples F51300-1 thru -17 were analyzed in conjunction with this LCS.

- Sample OP21730-BS was used as the solid LCS during the 8/9/07 pesticide analysis. Endrin aldehyde (11%) had a low recovery, and was not detected in any field samples – the endrin aldehyde results have been qualified "UL" as estimated in associated samples. All other pesticides met recovery criteria. Samples F51300-18 thru -30 were analyzed in conjunction with this LCS.

- Sample OP21658-BS was used as the aqueous LCS during the 8/1/07 PCB analysis. All criteria were met. No qualifiers were applied.

- Sample OP21715-BS was used as the solid LCS during the 8/6/07 PCB analysis. All criteria were met. No qualifiers were applied.

- Sample OP21731-BS was used as the solid LCS during the 8/7/07 PCB analysis. All criteria were met. No qualifiers were applied.

VIII-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD solid matrix MS/MSD recovery limits follow the LCS criteria specified in Tables D-15 and D-17 of the DoD QSM (DoD, 2006), while aqueous MS/MSD recovery limits follow the LCS criteria specified in Tables D-14 and D-16 of the DoD QSM. If the compound is not listed, then the laboratory criteria shall be used.

- Sample F51353-8 was used for the aqueous pesticide MS/MSD analysis. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Sample F51300-31 was analyzed in conjunction with this MS/MSD.

- Sample F51300-11 was used for the solid matrix pesticide MS/MSD analysis. Delta-BHC (51%) and endrin aldehyde (0%, 0%) had low recoveries in the MS and MSD, as well as having low recoveries in the associated LCS. All sample results have already been qualified "UL", no further qualification is required. All other pesticides met criteria. Samples F51300-1 thru -17 were analyzed in conjunction with this MS/MSD.

- Sample F51300-29 was used for the solid matrix pesticide MS/MSD analysis. Endrin aldehyde (16%, 16%) had low recoveries in the MS and MSD, as well as having low recoveries in the associated LCS. All sample results have already been qualified "UL", no further qualification is required. All other pesticides met criteria. Samples F51300-18 thru -30 were analyzed in conjunction with this MS/MSD.

- Sample F51314-1 was used for the aqueous PCB MS/MSD analysis. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Sample F51300-31 was analyzed in conjunction with this MS/MSD.

- Sample F51300-1 was used for the solid matrix PCB MS/MSD analysis. All PCBs met criteria. No data qualifiers were applied. Samples F51300-1 thru -17 were analyzed in conjunction with this MS/MSD.

- Sample F51300-29 was used for the solid matrix PCB MS/MSD analysis. All PCBs met criteria. No data qualifiers were applied. Samples F51300-1 thru -17 were analyzed in conjunction with this MS/MSD.

IX-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field duplicate pairs in this data package included 59SB04C (F51300-9) & TMSB04C (F51300-10), 59SB02B (F51300-12) & TMSB02B (F51300-13), and 43SB10B (F51300-28) & TMSB10B (F51300-30). All compounds detected above the reporting limit (RL) met RPD criteria.

X-Quantitation Verification
The accuracy of analytical results was verified through the calculation of several parameters. The difference between the calculated value and the reported value must be within 10% difference. All positive values must have less than or equal to 40% %D between the primary and secondary columns. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J." All criteria were met.

- During analysis of F51300-16, dieldrin (100%) %D was outside criteria. All other target compounds were within criteria. The dieldrin results have been qualified "J" as estimated.

Sample: OP21716-BS, beta-BHC

Conc. µg/kg = (Ax * Vt * DF) / (CF * Vi * Ws * Ps * 1000)

where: Ax = Area response for the compound being measured
Vt = Total volume of extract, taking into account dilutions (uL)
DF = Dilution factor
CF = Calibration Factor from initial calibration (area/pg)
Vi = Volume of extract injected (uL)
Ws = weight of sample (g)
Ps = percent solids/100

Conc. µg/kg = (705390 * 10000 * 1) / (19750 * 1 * 30 * 1 * 1000)
= 11.9 ug/kg

Reported Conc. = 11.9 µg/kg
%D = 0.0%
Values were within 10% difference

Sample: OP21715-BS, Aroclor 1260

Conc. µg/kg = (Ax * Vt * DF) / (CF * Vi * Ws * Ps * 1000)

where: Ax = Area response for the compound being measured
Vt = Total volume of extract, taking into account dilutions (uL)
DF = Dilution factor
CF = Calibration Factor from initial calibration (area/pg)
Vi = Volume of extract injected (uL)
Ws = weight of sample (g)
Ps = percent solids/100

Signal #1
Conc1 µg/L = (3211932 * 10000* 1) / (8380 * 1 * 30 * 1000) = 127.76 µg/kg
Conc2 µg/L = (4273339 * 10000* 1) / (10410 * 1 * 30 * 1000) = 136.83 µg/kg
Conc3 µg/L = (4293784 * 10000* 1) / (10450 * 1 * 30 * 1000) = 136.96 µg/kg
Conc4 µg/L = (2923739 * 10000* 1) / (7516 * 1 * 30 * 1000) = 129.67 µg/kg
Conc5 µg/L = (6792273 * 10000* 1) / (17360 * 1 * 30 * 1000) = 130.42 µg/kg
Conc6 µg/L = (3912029 * 10000* 1) / (9980 * 1 * 30 * 1000) = 130.66 µg/kg
Average concentration = 132 µg/kg

Reported Value = 132 µg/kg (from signal #1)
% Difference = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

N (Metals) = Laboratory spike sample recovery not within control limits.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.
