MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Semi-Volatiles & Polynuclear Aromatic Hydrocarbons Accutest Laboratories, Inc., SDG F51300

DATE: December 20, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on July 25, 2007. Samples were analyzed for semivolatile organic compounds (SVOCs) using USEPA SW846 Methods 3550B/8270C (solids) and 3510C/8270C (aqueous). The polynuclear aromatic hydrocarbons (PAHs) were analyzed using selective ion monitoring (SIM) techniques. A total of 1 aqueous and 30 soil samples were validated. The sample IDs are:

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No

RFAAP VALIDATION REPORT
SEMIVOLATILES AND PAH REVIEW
SDG F51300

I-Holding Times and Preservation

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: Solid samples must be stored @4°C ± 2°C with a maximum holding time of 14 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis. Aqueous samples must be cooled @4°C ± 2°C with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 7/25/07 were sent in five coolers, and were received by the laboratory on 7/26/07 at temperatures ranging from 2.6 °C to 4.0 °C. No qualifiers were applied.

- Holding Time Review: The samples were collected on 7/25/07. The aqueous sample was extracted for SVOCs on 7/31/07, extracted for PAHs by SIM on 7/31/07, analyzed for SVOCs on 8/2/07, and analyzed for PAHs by SIM on 8/2/07. The solid matrix samples were extracted for SVOCs on 8/2/07 & 8/3/07; extracted for PAHs by SIM on 8/2/07 & 8/3/07; analyzed for SVOCs on 8/3/07, 8/6/07, & 8/7/07; and analyzed for PAHs by SIM on 8/7/07 & 8/8/07. All criteria were met. No qualifiers were applied.

II-Instrument Performance Check

GC/MS instrument performance checks are performed to ensure mass resolution, identification and, to some degree, sensitivity. The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed.

- The instrument performance check, decafluorotriphenylphosphine (DFTPP), met the ion abundance criteria. No qualification was applied.

III-Initial Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for compounds on the semivolatile target compound list (TCL). Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. For compounds analyzed using linear regression or second order, correlation coefficients must be >0.995 and coefficients of determination >0.99. The minimum relative response factor (RRF) criteria must be ≥0.05. The DoD QSM specifies that the initial calibration percent relative standard deviation (%RSD) must be ≤15% on the average for all compounds (<30% for CCCs). All detects are qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- Initial calibration for the SVOCs was performed on 7/5/07 using instrument MSBNA02 (GCMSL). Target compounds 2,4-dinitrophenol (19.68%) and 4,6-dinitro-2-methylphenol (25.87%) had %RSDs outside criteria. All other target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). The compounds with high %RSD were quantified using linear or second order regression, and had correlation coefficients ≥0.995; therefore no qualifiers were applied. Sample F51300-31 were analyzed in conjunction with this initial calibration.

- Initial calibration for the PAHs-SIM was performed on 7/18/07 using instrument MSBNA3 (GCMSR). All target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05); no qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

- Initial calibration for the SVOCs was performed on 7/13/07 using instrument MSBNA04 (GCMSU). Target compounds 2,4-dinitrophenol (42.04%) and 4,6-dinitro-2-methylphenol (24.04%) had %RSDs outside criteria. All other target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). The compounds with high %RSD were quantified using linear or second order regression, and had correlation coefficients ≥0.995; therefore no qualifiers were applied. All solid matrix samples (F51300-1 thru -30) were analyzed in conjunction with this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used was capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Continuing calibration standards containing both target and surrogates compounds are analyzed at the beginning of each 12-hour analysis period following the analysis of the instrument performance check and prior to the analysis of blanks and samples. The minimum relative response factors (RRF) for semivolatile target compounds and surrogates must be ≥0.05. The DoD QSM specifies that the percent difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within ±20% for all target compounds. Grossly exceeding is defined where %D>40%. All detects are qualified as estimated "J" for where there were exceeding %Ds, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- During the SVOC initial calibration verification performed on 7/5/07 @1527 using instrument MSBNA02 (GCMSL), 3-nitroaniline (26.0%) had %D outside criteria. All other target compounds met criteria. No samples were analyzed following this initial calibration verification, no qualifiers were applied.

- During the SVOC initial calibration verification performed on 7/5/07 @1555 using instrument MSBNA02 (GCMSL), all target compounds met criteria. No samples were analyzed following this initial calibration verification, no qualifiers were applied.

- During the SVOC continuing calibration performed on 8/1/07 @1616 using instrument MSBNA02 (GCMSL), 2,4-dinitrophenol (33.0%) and 4,6-dinitro-2-methylphenol (22.1%) had %D outside criteria. All other target compounds met criteria. The MS and MSD were the only samples analyzed following this continuing calibration. Therefore, no qualifiers were applied.

- During the SVOC continuing calibration performed on 8/2/07 @1324 using instrument MSBNA02 (GCMSL), all target compounds met criteria. No qualifiers were applied. Sample F51300-31 was analyzed following this continuing calibration.

- During the PAH-SIM initial calibration verification performed on 7/18/07 @0634 using instrument MSBNA3 (GCMSR), all criteria were met for all target compounds. No qualifiers were applied. No samples were analyzed following this initial calibration verification.

- During the PAH-SIM continuing calibration performed on 8/2/07 @1000 using instrument MSBNA3 (GCMSR), all criteria were met for all target compounds. No qualifiers were applied. Sample F51300-31 was analyzed following this continuing calibration.

- During the PAH-SIM continuing calibration performed on 8/6/07 @2107 using instrument MSBNA3 (GCMSR), all criteria were met for all target compounds. No qualifiers were applied. Samples F51300-1, -2, -3, -4, -5, -6, -7, -8, -9, -10, -11, -12, -13, -14, -15, and -16 were analyzed following this continuing calibration.

- During the PAH-SIM continuing calibration performed on 8/7/07 @1245 using instrument MSBNA3 (GCMSR), all criteria were met for all target compounds. No qualifiers were applied. Sample F51300-17 was analyzed following this continuing calibration.

- During the PAH-SIM continuing calibration performed on 8/8/07 @1443 using instrument MSBNA3 (GCMSR), all criteria were met for all target compounds. No qualifiers were applied. Samples F51300-18, -19, -20, -21, -22 -23, -24, -25, -26, -27, -28, -29 and -30 were analyzed following this continuing calibration.

- During the SVOC initial calibration verification performed on 7/13/07 @1348 using instrument MSBNA04 (GCMSU), 4-chloroaniline (38.2%) and 3-nitroaniline (39.0%) had %D outside criteria. All other target compounds met criteria. No samples were analyzed following this initial calibration verification, no qualifiers were applied.

- During the SVOC initial calibration verification performed on 7/13/07 @1419 using instrument MSBNA04 (GCMSU), all target compounds met criteria. No samples were analyzed following this initial calibration verification, no qualifiers were applied.

- During the SVOC continuing calibration performed on 8/3/07 @0952 using instrument MSBNA04 (GCMSU), all target compounds met criteria. No qualifiers were applied. Samples F51300-1, -2, -3, -4, -5, -6, -7, -8, -9, -10, -11, -12, and -13 were analyzed following this continuing calibration.

- During the SVOC continuing calibration performed on 8/6/07 @1128 using instrument MSBNA04 (GCMSU), all target compounds met criteria. No qualifiers were applied. Samples F51300-14, -15, -16, and -17 were analyzed following this continuing calibration.

- During the SVOC continuing calibration performed on 8/7/07 @0942 using instrument MSBNA04 (GCMSU), all target compounds met criteria. No qualifiers were applied. Samples F51300-18, -19, -20, -21, -22 -23, -24, -25, -26, -27, -28, -29 and -30 were analyzed following this continuing calibration.

V-Blank Analysis

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. A method blank analysis must be performed after the calibration standards and once every 12-hour time period beginning with the injection of DFTPP. No contaminants should be detected in any of the associated blanks > the MDL. DoD QSM criteria specifies all concentrations should be less than one-half MRL (<MRL for common laboratory contaminants phthalate esters). Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants phthalate esters, or 5 times (5X) the maximum amount for other semivolatile target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/kg	Action Level µg/kg	B qualified samples
8/2/07	OP21675-MB	All SVOC target <½MRL	NA	NA	None
8/3/07	OP21718-MB	All SVOC target <½MRL	NA	NA	None
8/6/07	OP21718-MB	All SVOC target <½MRL	NA	NA	None
8/7/07	OP21737-MB	All SVOC target <½MRL	NA	NA	None
8/2/07	OP21676-MB	All PAH SIM target <½MRL	NA	NA	None
8/6/07	OP21719-MB	All PAH SIM target <½MRL	NA	NA	None
8/7/07	OP21719-MB	All PAH SIM target <½MRL	NA	NA	None
8/8/07	OP21738-MB	All PAH SIM target <½MRL	NA	NA	None
8/2/07	072507R	All SVOC target <½MRL	NA	NA	None
8/2/07	072507R	All PAH SIM target <½MRL	NA	NA	None
8/2/07	072607R	All SVOC target <½MRL	NA	NA	None
8/2/07	072607R	All PAH SIM target <½MRL	NA	NA	None

072507R & 072607R are rinsate blanks.
NA = Not applicable.
MRL = Method reporting limit.

VI-Surrogate Spikes

Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Surrogate spikes are added to all samples and blanks to measure their recovery in sample and blank matrices. The percent recoveries (%Rs) must be within the specified control limits. DoD surrogate recovery limits are specified in Tables D-2 & D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Criteria:
2-Fluorophenol (14-62%) – (DoD QSM = 20-110%)
Phenol-d5 (10-40%) – (DoD QSM = 10-115%)
2,4,6-Tribromophenol (33-118%) – (DoD QSM = 40-125%)
Nitrobenzene-d5 (42-108%) – (DoD QSM = 40-110%)
2-Fluorobiphenyl (40-106%) – (DoD QSM = 50-110%)
p-Terphenyl-d14 (39-121%) – (DoD QSM = 50-135%)

Solid Criteria:
2-Fluorophenol (40-102%) – (DoD QSM = 35-105%)
Phenol-d5 (41-100%) – (DoD QSM = 40-100%)
2,4,6-Tribromophenol (42-108%) – (DoD QSM = 35-125%)
Nitrobenzene-d5 (40-105%) – (DoD QSM = 35-100%)
2-Fluorobiphenyl (43-107%) – (DoD QSM = 45-105%)
p-Terphenyl-d14 (45-119%) – (DoD QSM = 30-125%)

- All samples met surrogate recovery criteria. No qualifiers were applied.

VII-Internal Standards

Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Internal standard area counts for samples and blanks must not vary by more than a factor of two (-50% to +100%) from the associated calibration standard. The retention time of the internal standards in samples and blanks must not vary by more than ±30 seconds from the retention time of the associated calibration standard.

- All samples met criteria. No qualifiers were applied.

VIII-Laboratory Control Sample

Laboratory control samples (LCS) are used to monitor laboratory accuracy by calculating the percent recoveries of the spiked compounds. All LCS percent recoveries must be within the specified control limits. DoD solid matrix LCS recovery limits are specified in Table D-7 of the DoD QSM (DoD, 2006), while aqueous recovery limits are specified in Table D-6 of the DoD QSM. If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP21675-BS was used as the aqueous LCS during SVOC analysis on 8/2/07. All compounds met recovery criteria. No qualifiers were applied. Sample 072507R was analyzed in conjunction with this LCS.

- Sample OP21718-BS was used as the solid LCS during SVOC analysis on 8/3/07. All compounds met recovery criteria. No qualifiers were applied. Samples F51300-1 thru -17 were analyzed in conjunction with this LCS.

- Sample OP21737-BS was used as the solid LCS during SVOC analysis on 8/7/07. All compounds met recovery criteria. No qualifiers were applied. Samples F51300-18 thru -30 were analyzed in conjunction with this LCS.

- Sample OP21676-BS was used as the aqueous LCS for the PAH-SIM analysis on 8/2/07. All compounds met recovery criteria. No qualifiers were applied. Sample F51300-31 was analyzed in conjunction with this LCS.

- Sample OP21719-BS was used as the solid LCS for the PAH-SIM analysis on 8/6/07. All compounds met recovery criteria. No qualifiers were applied. Samples F51300-1 thru -17 were analyzed in conjunction with this LCS.

- Sample OP21738-BS was used as the solid LCS for the PAH-SIM analysis on 8/8/07. All compounds met recovery criteria. No qualifiers were applied. Samples F51300-18 thru -30 were analyzed in conjunction with this LCS.

IX-Matrix Spike/Matrix Spike Duplicate

Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD solid matrix MS/MSD recovery limits follow the LCS criteria specified in Table D-7 of the DoD QSM (DoD, 2006), while aqueous recovery limits follow the LCS criteria in Table D-6 of the DoD QSM. If the compound is not listed, then the laboratory criteria shall be used.

- Sample F51272-6 was used as the aqueous MS/MSD during SVOC analysis on 8/1/07. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. Sample F51300-31 was analyzed in conjunction with this MS/MSD.

- Sample F51300-5 was used as the solid MS/MSD during SVOC analysis on 8/3/07. All target compounds met recovery criteria. No qualifiers were applied. Samples F51300-1 thru -17 were analyzed in conjunction with this MS/MSD.

- Sample F51300-25 was used as the solid MS/MSD during SVOC analysis on 8/7/07. All target compounds met recovery criteria. No qualifiers were applied. Samples F51300-18 thru -30 were analyzed in conjunction with this MS/MSD.

- Sample F53100-31 was used as the aqueous MS/MSD during PAH SIM analysis on 8/2/07. All compounds met recovery criteria. No qualifiers were applied. Sample F51300-31 was analyzed in conjunction with this MS/MSD.

- Sample F53100-7 was used as the solid MS/MSD during PAH SIM analysis on 8/7/07. Chrysene (52%, 53%) and 1-methylnaphthalene (56%, 57%) had low recoveries in the MS & MSD; all chrysene and 1-methylnaphthalene results in associated samples have been qualified "J/UJ". All other target compounds met recovery criteria. Samples F51300-1 thru -17 were analyzed in conjunction with this MS/MSD.

- Sample F53100-25 was used as the solid MS/MSD during PAH SIM analysis on 8/8/07. All target compounds met recovery criteria. Samples F51300-18 thru -30 were analyzed in conjunction with this MS/MSD.

X-Field Duplicate Sample Analysis

Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field duplicate pairs in this data package included 59SB04C (F51300-9) & TMSB04C (F51300-10), 59SB02B (F51300-12) & TMSB02B (F51300-13), and 43SB10B (F51300-28) & TMSB10B (F51300-30). All compounds detected above the reporting limit (RL) met RPD criteria.

XI-Quantitation Verification

The accuracy of analytical results was verified through the calculation of several parameters. Percent difference (%D) between the calculated and reported values must be ≤10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J."

Sample: F51300-16, di-n-butyl phthalate

Conc. (µg/kg) = {(Ax)*(Is)*(Vt)*(DF)}/{(Ais)*(RRF)*(V_i)*(Ws)*(Ps)}

where:	Conc	=	Sample concentration in µg/kg
	A_x	=	Area of characteristic ion for compound being measured.
	I_s	=	Amount of internal standard injected (ng).
	V_t	=	Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10,000 µL.
	DF	=	Dilution Factor
	A_{is}	=	Area of characteristic ion for the internal standard.
	RRF_A	=	Average relative response factor for compound being measured
	V_i	=	Volume of extract injected (µL).
	Ws	=	weight of sample (g)
	Ps	=	percent solids/100

Conc. µg/L = (735472 * 40 * 1000 * 2) / (691959 *1.457 * 1 * 30.4 * 0.817) = 2350 ug/kg

Reported Value = 2350 µg/kg
% Difference = 0.0%
Values were within 10% difference.

Sample: F51300-11, chrysene

Conc. (µg/kg) = {(Ax)*(Is)*(Vt)*(DF)}/{(Ais)*(RRF)*(V_i)*(Ws)*(Ps)}

where:	Conc	=	Sample concentration in µg/kg
	A_x	=	Area of characteristic ion for compound being measured.
	I_s	=	Amount of internal standard injected (ng).
	V_t	=	Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10,000 µL.
	DF	=	Dilution Factor
	A_{is}	=	Area of characteristic ion for the internal standard.
	RRF_A	=	Average relative response factor for compound being measured
	V_i	=	Volume of extract injected (µL).
	Ws	=	weight of sample (g)
	Ps	=	percent solids/100

Conc. µg/L = (6444 * 4 * 1000 * 4) / (121726 * 1.586 * 1 * 30.8 * 0.895) = 19.4 ug/kg

Reported Value = 19.4 µg/kg
% Difference = 0.1%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation - Volatiles
Accutest Laboratories, Inc., SDG F51300

DATE: December 19, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on July 25, 2007. The samples were analyzed for target compound list (TCL) volatile organic compounds (VOCs) using USEPA SW846 Method 5030B/8260B for aqueous samples and 5035A/8260B for soil samples. A total of 3 aqueous and 30 soil samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
59SB06A	F51300-1	43SB07A	F51300-18
59SB06B	F51300-2	43SB07B	F51300-19

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter

RFAAP VALIDATION REPORT
VOLATILES REVIEW
SDG F51300

I-Holding Times and Preservation
The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of analysis. Holding time criteria: Aqueous samples must be cooled @ 4°C±2°C and acidified to pH<2 with HCl, with a maximum holding time of 14 days (7 days if no HCl added) from sample collection to analysis. Soil samples must be cooled @ 4°C±2°C, with a maximum holding time of 14 days from sample collection to analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 7/25/07 were sent in five coolers, and were received by the laboratory on 7/26/07 at temperatures ranging from 2.6 °C to 4.0 °C. No qualifiers were applied.

- Holding Time Review: All samples were collected for VOCs on 7/25/07, and were analyzed on 7/31/07, 8/1/07, and 8/2/07. All criteria were met. No qualifiers were applied.

II-Instrument Performance Check
The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed.

- The instrument performance check, bromofluorobenzene (BFB), met the ion abundance criteria. No qualification was applied.

III-Initial Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The RRF must be greater than 0.1 for chloromethane, 1,1-dichloroethane, and bromoform and greater than 0.3 for 1,1,2,2-tetrachloroethane and chlorobenzene. The minimum relative response factor (RRF) must be ≥0.05 for all other compounds. The DoD QSM specifies that the percent relative standard deviation (%RSD) must be ≤15% for each target compound and must be ≤30% for each calibration check compound. For compounds analyzed using linear regression or second order, correlation coefficients must be >0.995 and coefficients of determination >0.99. All detects are qualified as estimated "J" for exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For compounds with low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- During the initial calibration performed on 07/25/07 on instrument MSVOA9 (GCMSF), target compounds methylene chloride (49.21%) and acetone (21.26%) were outside %RSD criteria. All other target compounds met %RSD criteria, and all compounds met RRF criteria. The compounds with high %RSD were quantified using linear or second order regression, and had correlation coefficients >0.995; therefore, no qualifiers were applied. Samples F51300-1 and F51300-2 were analyzed in conjunction with this initial calibration.

- During the initial calibration performed on 07/31/07 on instrument MSVOA1 (GCMSG), target compounds chloromethane (19.70%), vinyl chloride (16.26%), bromomethane (33.30%), chloroethane (18.67%), acetone (17.23%), and methylene chloride (41.28%) were outside %RSD criteria. All other target compounds met %RSD criteria, and all compounds met RRF criteria. The compounds with high %RSD (except chloromethane) were quantified using linear or second order regression, and had correlation coefficients >0.995 (except bromomethane which had a correlation coefficient of 0.994). No chloromethane (listed on Form I as methyl chloride) was detected in the associated samples so qualifiers were applied to the chloromethane data. Bromomethane (listed on Form I as methyl bromide) results in associated samples have been qualified "J/UJ". Samples F51300-15, -16, -17, -18, -19, -20, -21, -22, -23, -24, -25, -26, -27, -28, -30, and -32 were analyzed in conjunction with this initial calibration.

- During the initial calibration performed on 07/16/07 on instrument MSVOA3 (GCMSH), target compounds acetone (18.53%), methylene chloride (32.02%), trichloroethene (24.48%), ethylbenzene (15.12%), m,p-xylene (16.56%), and o-xylene (15.44%) were outside %RSD criteria. All other target compounds met %RSD criteria, and all compounds met RRF criteria. The compounds with high %RSD were quantified using linear or second order regression, and had correlation coefficients >0.995; therefore, no qualifiers were applied. Samples F51300-3, -4, -5, -6, -7, -8, -9, -10, -11, -12, -13, -14, and -29 were analyzed in conjunction with this initial calibration.

- During the initial calibration performed on 07/31/07 on instrument MSVOA6 (GCMSJ), target compounds bromomethane (22.0%), chloroethane (21.95%), methylene chloride (123.02%), and trans-1,3-dichloropropene (21.19%) were outside %RSD criteria. All other target compounds met %RSD criteria, and all compounds met RRF criteria. The compounds with high %RSD were quantified using linear or second order regression, and had correlation coefficients >0.995; therefore, no qualifiers were applied. Samples F51300-31 & -33 were analyzed in conjunction with this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Continuing calibration establishes the 12-hour relative response factors on which the quantitations are based and checks satisfactory performance of the instrument on a day-to-day basis. The RRF must be greater than 0.1 for chloromethane, 1,1-dichloroethane, and bromoform and greater than 0.3 for 1,1,2,2-tetrachloroethane and chlorobenzene. The minimum relative response factor (RRF) must be ≥0.05 for all other compounds. The DoD QSM specifies that the percent difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within 20% for all target compounds. All detects are qualified as estimated "J" for exceeding %Ds, and all non-detects are qualified as estimated "UJ" for grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- During the initial calibration verification performed on 7/25/07 @1534 on instrument MSVOA9 (GCMSF), bromomethane (28.8%) had a %D outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). No samples were analyzed following this initial calibration verification.

- During the continuing calibration performed on 7/31/07 @1226 on instrument MSVOA9 (GCMSF), all target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). Samples F51300-1 and F51300-2 were analyzed following this continuing calibration.

- During the initial calibration verification performed on 7/31/07 @1408 on instrument MSVOA1 (GCMSG), vinyl chloride (23.5%), bromomethane (29.6%), chloroethane (24.1%), acetone (25.2%) had %D outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). No samples were analyzed following this initial calibration verification.

- During the continuing calibration performed on 7/31/07 @1532 on instrument MSVOA1 (GCMSG), all target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). No qualifiers were applied. Samples F51300-15, -16, -17, -18, -19, -21, -22, -24, -25, -26, -27, -28, -30, and -32 were analyzed following this initial calibration.

- During the continuing calibration performed on 8/1/07 @0917 on instrument MSVOA1 (GCMSG), acetone (23.8%) and carbon tetrachloride (32.1%) had %D/%drift outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). Detections of these volatiles in the associated samples have been qualified "J", non-detects were not qualified. Samples F51300-20 and -23 were analyzed following this continuing calibration.

- During the initial calibration verification performed on 7/16/07 @1820 on instrument MSVOA3 (GCMSH), bromomethane (36.1%) had a %D outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). No samples were analyzed following this initial calibration verification.

- During the continuing calibration performed on 7/31/07 @1112 on instrument MSVOA3 (GCMSH), bromomethane (27.9%), chloroethane (25.4%), acetone (75.0%), 2-butanone (22.9%), and trichloroethene (20.7%) had %D/%drift outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). Detections of these volatiles in the associated samples have been qualified "J", acetone non-detects have been qualified "UJ", all other non-detects were not qualified. Samples F51300-3, -4, -5, -6, -8, -9, -10, -14, and -29 were analyzed following this continuing calibration.

- During the continuing calibration performed on 8/1/07 @1018 on instrument MSVOA3 (GCMSH), acetone (81.3%), 2-butanone (27.8%), and carbon tetrachloride (21.5%) had %D/%drift outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). Detections of these volatiles in the associated samples have been qualified "J", acetone non-detects have been qualified "UJ", all other non-detects were not qualified. Samples F51300-7, -11, -12, and -13 were analyzed following this continuing calibration.

- During the initial calibration verification performed on 7/31/07 @1339 on instrument MSVOA6 (GCMSJ), bromomethane (21.8%), acetone (22.5%), trans-1,3-dichloropropene (20.5%), had a %D outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). No samples were analyzed following this initial calibration verification.

- During the continuing calibration performed on 8/2/07 @0947 on instrument MSVOA6 (GCMSJ), all target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). Samples F51300-31 & -33 were analyzed following this initial calibration verification.

V-Blank Analysis

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. A method blank analysis must be performed after the calibration standards and once every 12-hour time period beginning with the injection of BFB. No contaminants should be detected in any of the associated blanks > the MDL. The DoD QSM criteria specifies all concentrations should be less than one-half MRL (<MRL for common laboratory contaminants methylene chloride, acetone, and 2-butanone). Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants methylene chloride, acetone, and 2-butanone (MEK), or 5 times (5X) the maximum amount for other volatile target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
7/31/07	VH1665-MB	All target <½MRL	NA	NA	None
7/31/07	VF416-MB	All target <½MRL	NA	NA	None
7/31/07	VG1720-MB	All target <½MRL	NA	NA	None
8/1/07	VG1721-MB	All target <½MRL	NA	NA	None
8/1/07	VH1666-MB	All target <½MRL	NA	NA	None
8/2/07	VJ2193-MB	All target <½MRL	NA	NA	None
8/2/07	072507R	All target <½MRL	NA	NA	None
8/6/07	072607R	All target <½MRL	NA	NA	None
7/31/07	TB072507S	All target <½MRL	NA	NA	None
8/2/07	TB072507W	All target <½MRL	NA	NA	None

072507R and 072607R are rinsate blanks.
NA = Not Applicable
MRL = Method Reporting Limit

VI-Laboratory Control Sample

Data for laboratory control samples (LCS) are evaluated to determine long-term accuracy of the analytical method on various matrices. Percent recoveries (%Rs) should be within the specified control limits. The aqueous LCS recovery limits are specified in Table D-4 of the DoD QSM (DoD, 2006), while the solid matrix LCS recovery limits are specified in Table D-5 of the DoD QSM. If the compound is not listed, then the laboratory criteria shall be used.

- Sample VH1665-BS was the solid LCS for the VOC analysis using instrument H on 7/31/07. All target compound recoveries were within criteria, no data qualification was required. Samples F51300-3, -4, -5, -6, -8, -9, -10, -14, and -29 were analyzed in conjunction with this LCS.

- Sample VF416-BS was the solid LCS for the VOC analysis using instrument F on 7/31/07. All target compound recoveries were within criteria, no data qualification was required. Samples F51300-1 and -2 were analyzed in conjunction with this LCS.

- Sample VG1720-BS was the solid LCS for the VOC analysis using instrument G on 7/31/07. All target compound recoveries were within criteria, no data qualification was required. Samples F51300-15, -16, -17, -18, -19, -21, -22, -24, -25, -26, -27, -28, -30, and -32 were analyzed in conjunction with this LCS.

- Sample VG1721-BS was the solid LCS for the VOC analysis using instrument G on 8/1/07. Vinyl chloride (126%) had a high recovery, but no vinyl chloride was detected in the associated samples so no data qualification was required. All other target compound recoveries were within criteria. Samples F51300-20 and -23 were analyzed in conjunction with this LCS.

- Sample VH1666-BS was the solid LCS for the VOC analysis using instrument H on 8/1/07. All target compound recoveries were within criteria, no data qualification was required. Samples F51300-7, -11, -12, and -13 were analyzed in conjunction with this LCS.

- Sample VJ2193-BS was the aqueous LCS for the VOC analysis using instrument J on 8/2/07. All target compound recoveries were within criteria, no data qualification was required. Samples F51300-31 and -33 were analyzed in conjunction with this LCS.

VII-Matrix Spike/Matrix Spike Duplicate

Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. The MS/MSD aqueous recovery limits follow the LCS criteria specified in Table D-4 of the DoD QSM (DoD, 2006), while the solid matrix recovery limits follow the LCS criteria specified in Table D-5 of the DoD QSM. If the compound is not listed, then the laboratory criteria shall be used.

- Sample F51300-29 was used for solid matrix MS/MSD analysis on 7/31/07. Carbon tetrachloride (139%, 141%), toluene (133%), and trichloroethene (130%) were outside DoD QSM recovery criteria. Detections of these compounds have been qualified "J" in the associated samples; non-detects were not qualified. All other target compounds met recovery criteria. All samples were analyzed in conjunction with this MS/MSD.

- Sample F51300-25 was used for the solid MS/MSD analysis on 07/31/07. Ethylbenzene (0%) 1,1,2,2-tetrachloroethane (187%), 1,1,2-trichloroethane (162%), and vinyl chloride (129%), were outside DoD QSM recovery criteria. All ethylbenzene results (detections and non-detects) have been qualified "J/UJ" in the associated samples. Detections of the other compounds with high recoveries have been qualified "J" in the associated samples. The other target compounds met recovery criteria. All samples were analyzed in conjunction with this MS/MSD.

VIII-System Monitoring Compounds (Surrogates)

Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Recoveries for system monitoring compounds in volatile samples and blanks must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous criteria:	Dibromofluoromethane (87-116%) (DoD QSM = 85-115%) 1,2-Dichloroethane-d4 (76-127%) (DoD QSM = 70-120%) Toluene-d8 (86-112%) (DoD QSM = 85-120%) 4-Bromofluorobenzene (84-120%) (DoD QSM = 75-120%)
Solid matrix criteria:	Dibromofluoromethane (80-121%) (DoD QSM = none) 1,2-Dichloroethane-d4 (77-123%) (DoD QSM = none) Toluene-d8 (71-130%) (DoD QSM = 85-115%) 4-Bromofluorobenzene (59-148%) (DoD QSM = 85-120%)

- All solid matrix samples and all aqueous samples met surrogate recovery criteria. No qualifiers were applied.

IX-Internal Standards (IS)

Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Specific criteria include: area counts (-50% to +100%) of the associated calibration standard, and retention time (± 30 seconds) from that of the associated calibration standard.

- Sample F51300-25 had a low 1,4-dichlorobenzene-d4 area count. All volatiles quantitated from this internal standard have been qualified "J/UJ".

- All other solid matrix samples and all aqueous samples met criteria. No qualifiers were applied.

X-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field duplicate pairs in this data package included 59SB04C (F51300-9) & TMSB04C (F51300-10), 59SB02B (F51300-12) & TMSB02B (F51300-13), and 43SB10B (F51300-28) & TMSB10B (F51300-30). All compounds detected above the reporting limit (RL) met RPD criteria.

XI-Quantitation Verification
The accuracy of analytical results is verified through the calculation of several parameters. The percent difference (%D) between the calculated and the reported values should be within 10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J."

Sample: 43SB09B (F51300-25), ethylbenzene

Conc. (µg/kg) = (Ax * Is * DF)/(Ais * RRF * Ws * Ps)

where:	Conc	=	sample concentration in µg/kg
	Ax	=	area of characteristic ion for compound being measured
	Is	=	amount of internal standard added (ng)
	DF	=	dilution factor
	Ais	=	Area of characteristic ion for the internal standard
	RRF	=	average relative response factor
	Ws	=	weight of sample (g)
	Ps	=	percent solids/100

Conc. µg/L = (1215748 * 250 ng * 1) / (551729 * 1.977 * 5.19 * 0.869) = 61.8 µg/kg

Reported Conc. = 61.8 µg/kg
%D = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Dioxin Furans
SGS Paradigm Analytical Laboratories, Inc. Project G383-600
(Accutest SDG F52170)

DATE: November 7, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on August 29, 2007. The samples were analyzed for Dioxin and Furan compounds using USEPA SW-846 Method 8290 High Resolution Gas Chromatography/High Resolution Mass Spectroscopy (HRGC/HRMS). A total of eight aqueous samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
59MW01	F52170-1	48MW3	F52170-5
48MW1	F52170-2	TMMW3	F52170-6
TMMW01	F52170-3	48MW4	F52170-7
48MW2	F52170-4	49MW1	F52170-8

Data were reviewed and validated using a combination of project QAPP, *DOD Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *USEPA Region III Dioxin/Furan Data Validation Guidance* (March, 1999). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Blank Analysis
	X	Instrument Performance Check
	X	Initial Calibration
X		Continuing Calibration
	X	Internal Standards (IS) Recovery Standard Solutions
	X	Cleanup Standards
	X	Laboratory Control Standard or Ongoing Precision Result (OPR)
	X	Matrix Spike and Spike Duplicate
	X	Field Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Richard McCracken, Chemist

RFAAP VALIDATION REPORT
DIOXIN FURAN REVIEW
SDG G383-600
(Accutest SDG F52170)

I-Holding Times and Preservation

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. For aqueous samples, dioxin and furans are shipped @4°C ± 2°C, with a maximum holding time of 30 days from sample collection to preparative extraction and 45 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 8/29/07 were sent in 20 coolers, and were received by the laboratory on 8/30/07 at temperatures ranging from 0.8°C to 3.6°C, with 9 of the 20 coolers having temperatures below 2.0°C. The low sample temperatures are not expected to have an adverse impact on the analytical results. Accutest shipped the dioxin aliquot to SGS Paradigm Analytical Laboratories on 8/30/07, they were received by DataChem on 8/31/07 at 2.6°C. No qualifiers were applied.

- Holding Time Review: The samples were collected on 8/29/07, extracted on 9/10/07, and analyzed on 9/12/07. All criteria were met. No qualifiers were applied.

II-Blank Analysis

The purpose of laboratory (or field) blank analyses is to determine the existence and magnitude of contamination problems resulting from field and laboratory activities. No contamination should be found in any of the blanks >EDL (estimated detection limit). The DoD QSM criteria specifies all concentrations should be less than ½ MRL (<MRL for common laboratory contaminants OCDD and OCDF) and <2EDL for the calibration blanks. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants OCDD or OCDF, or 5 times (5X) the maximum amount for other target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. ng/L	Action Level ng/L	B qualified samples
9/8/07	LMB14461	All congeners <EDL	NA	NA	None
9/9/07	RB083007	All congeners <EDL	NA	NA	None

J = Estimated value <MRL and >EDL.

III-Instrument Performance Check

Instrument must be tuned with perfluorokerosene (PFK) to achieve a static resolving power of at least 10,000 (10% valley) and lock-mass ion between lowest and highest masses for each descriptor and level of reference compound ≤10%. Documentation of the mass spectrometer resolving power is accomplished by recording the peak profile of the high-mass reference signal (typically m/z 330.9792) obtained during a peak examination by using the low-mass PFK ion at m/z 292.9825 or lower in mass as reference. At the beginning of the each 12-hour period, the chromatographic resolution is verified in the same fashion as in the initial calibration through the analysis of HRCC solution on the DB-5 (or equivalent) column or through the analysis of the column performance solution on the SP-2331 or SP-225 (or equivalent) column. A 25% valley must be achieved between the close eluters.

- All PFK forms were verified and found to be in compliance with method specification. No qualifiers were applied.

IV-Initial Calibration
Once the window defining mix has been analyzed and the descriptor switching times have been verified, the five point calibration solutions can be analyzed prior to sample analysis. Per method and DoD QSM, the initial calibration criteria are as follows:

- The percent relative standard deviations for the mean response factors RRF(n) from the 17 unlabeled standards must not exceed ±20%, and those for the labeled reference compounds must not exceed ±30%;
- The signal to noise ratio ≥10% for all target ions;
- Ion abundance ratios must be within the specified control limits in Table 8 (SW846 Method 8290).

- During initial calibration performed on 07/10/07 using instrument HRMS1, all compounds met criteria. No qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

V-Continuing Calibration
The continuing calibration consists of two parts: evaluation of the mass resolution and retention time check. Per method and DoD QSM, the following stipulates the continuing calibration criteria.

- The signal signal-to-noise ratio (S/N) must be at least 10:1 for each selected ion current profile (SICP) and for each GC signal representing the elution of a target analyte or labeled standard for each analyte.
- The relative response factor of each analyte for the unlabeled standard must be within ±20% of the average RF obtained from the initial calibration, and the RRF of each labeled standard must be within ±30% of the average RRF established during initial calibration. This is expressed in term of percent difference %D.
- Ion abundance ratios must be within the specified control limits in Table 8 (SW846 Method 8290).

- During the continuing calibration performed on 9/12/07 @0856 on instrument HRMS1, all criteria were met. No qualifiers were applied. All samples were analyzed following this continuing calibration.

- During the continuing calibration performed on 9/12/07 @2012 on instrument HRMS1, the following labeled standards had RFs >30%: 13C-1,2,3,7,8-PeCDD (31.1%), 13C-1,2,3,7,8-PeCDF; 13C-2,3,4,7,8-PeCDF. All PeCDDs and PeCDFs have been qualified "J/UJ". The other labeled and unlabeled standards met criteria. All samples were analyzed before this continuing calibration.

- During the continuing calibration performed on 9/13/07 @0753 on instrument HRMS1, all criteria were met. No qualifiers were applied. No samples were analyzed in conjunction with this continuing calibration.

VI-Internal Standards (IS) Recovery Standard Solutions
Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Specific criteria include: Recoveries of the isotopically-labeled recovery standards to fall within the 40 to 135 percent range for the tetra- through octachlorinated congeners, or as stated in the data package (DoD QSM limits 40-135%).

- All criteria were met. No qualifiers were applied.

VII-Cleanup Standards
Cleanup standards are added to every sample, blank, quality control sample, and calibration solution. This compound is added to the samples after extraction but prior to cleanup and is used to verify the percent recovery obtained using the isotope dilution technique. The control limits are 40 to 135 percent (DoD QSM limits 40-135%).

- All criteria were met. No qualifiers were applied.

VIII-Laboratory Control Standard (LCS) or Ongoing Precision Result (OPR)
LCSs are used to monitor laboratory accuracy and precision by calculating the percent recoveries of the spiked compounds. Per DOD QSM and method criteria, acceptable performance is determined by:

1. Recoveries of the isotopically-labeled extraction standards to fall within 40-135% control limits for the tetra- through octachlorinated congeners, or as stated in the data package;

2. Recoveries (accuracy) of the unlabeled compounds should be within ±35% when spiked at the method quantitation limit and within ±30% when spiked above 20 times the method quantitation limit, or as stated in the data package;

3. When duplicate OPR are required, the relative percent difference (RPD) of the unlabeled analytes concentrations should be within 30% when spiked at the method quantitation limit and within ±20% when spiked above 20 times the method quantitation limit.

- Sample OPR14461 was used as LCS and LCSD during the 9/12/07 analytical run. All criteria were met. No qualifiers were applied. All samples were analyzed in conjunction with this LCS.

IX-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. Per DoD QSM, MS/MSD recoveries must be within in-house laboratory limits (75-125%) and RPD ≤20%.

- MS/MSD analysis was performed on 48MW3. All analytes met recovery & RPD criteria.

X-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field duplicate pairs in this data set included 59MW01 (F52170-1) & TMMW01 (F52170-3), and 48MW3 (F52170-5) & TMMW3 (F52170-6). All compounds detected in 59MW01 & TMMW01 had RPDs > 50%, but the detections were below the lower method calibration limit where analytical precision is not expected. No data qualifiers were applied. No target analytes were detected in 48MW3 or TMMW3.

XI-Quantitation Verification

The accuracy of analytical results was verified through the calculation of at least one the several parameters such as the %D, %RSD, % recovery, and/or compound concentration. Values were found to be within 10%. Any value reported by the laboratory as estimated "A" based on an analyte to internal standard ratio below the calibration curve was qualified as estimated "J". The signal signal-to-noise ratio (S/N) must be greater than 2.5 for each selected ion current profile (SICP) and for each GC signal representing the elution of a target analyte or labeled standard. Any detected value with ether interference (I-lab flag) was qualified as estimated "J". For where the ion ratio failed the 25% criteria (*-lab flag), the estimated maximum possible concentration (EMPC) was reported and flagged estimated "J". For where presence of quantitation interference (Q-lab flag), the date was flagged estimated "J" for detects and "UJ" for non-detects.

- The 1,2,3,7,8-PeCDD, OCDD, 1,2,3,7,8-PeCDF, 2,3,4,7,8-PeCDF, 1,2,3,4,7,8-HxCDF, 1,2,3,6,7,8-HxCDF, 2,3,4,6,7,8-HxCDF, 1,2,3,7,8,9-HxCDF, and 1,2,3,4,6,7,8-HpCDF results in 59MW01 (F52170-1) have been qualified "J" as estimated since the amounts detected were less than the Lower Method Calibration Limit. The ion abundance ratio for 2,3,4,6,7,8-HxCDF did not meet criteria and has been reported as an Estimated Maximum Possible Concentration (EPMC). Since the result has already been qualified "J", no further qualification is required.

- The OCDD result in 48MW1 (F52170-2) has been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit. The ion abundance ratio for OCDD did not meet criteria and has been reported as an Estimated Maximum Possible Concentration (EPMC). Since the result has already been qualified "J", no further qualification is required.

- All target analytes were detected in TMMW01 (F52170-3) at concentrations less than the Lower Method Calibration Limit, and have been qualified "J" as estimated. The ion abundance ratio for OCDD did not meet criteria and has been reported as an Estimated Maximum Possible Concentration (EPMC). Since the result has already been qualified "J", no further qualification is required.

- The OCDD result in 48MW2 (F52170-4) has been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit.

- The OCDD result in 48MW4 (F52170-7) has been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit.

- The 1,2,3,4,6,7,8-HpCDD, 2,3,7,8-TCDF, 1,2,3,4,6,7,8-HpCDF, and OCDF results in 49MW01 (F52170-8) have been qualified "J" as estimated since the amount of each compound detected was less than the Lower Method Calibration Limit. The ion abundance ratio for OCDF did not meet criteria and has been reported as an Estimated Maximum Possible Concentration (EPMC). Since the result has already been qualified "J", no further qualification is required.

Sample: 49MW01 (F52170-8), OCDD

A(x) = sum of the integrated ion abundances of the quantitation ions for the unlabeled ions;
A(is) = sum of the integrated ion abundances of the quantitation ions for the labeled ions;
Q(is) = quantity, in ng/ul, of the internal standard added to the sample before extraction;
V = volume in mL of the aqueous sample; and
Avg. RRF(n) = calculated mean relative response factor for the unlabeled analyte.

$$\text{Conc. (ng/L)} = \frac{(A(x)) * Q(is) * 1000}{A(is) * V * \text{Avg. RRF}} = \frac{(3450000) * 4.0 * 1000}{(31600000) * 1000 * 1.1174} = 0.391 \text{ ng/L}$$

Reported Value = 0.391 ng/L
% Difference = 0.0%
Values were within 10% difference

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ EDL and <MRL or <3*EDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥EDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ EDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Explosives, PETN, & Nitroglycerin
Accutest Laboratories, Inc., SDG F52170

DATE: November 7, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on August 29, 2007. The samples were analyzed for explosives, nitroglycerin, and PETN using USEPA SW-846 3535A/8330A. A total of eight aqueous samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	**Field Sample ID**	Lab Sample ID
59MW01	F52170-1	48MW3	F52170-5
48MW1	F52170-2	TMMW3	F52170-6
TMMW01	F52170-3	48MW4	F52170-7
48MW2	F52170-4	49MW1	F52170-8

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Blank Analysis
	X	Initial Calibration
	X	Continuing Calibration
	X	System Monitoring Compounds
	X	Laboratory Control Sample
	X	Matrix Spike/Spike Duplicate
	X	Field Duplicate
	X	Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable.

Richard McCracken, Chemist

RFAAP VALIDATION REPORT
EXPLOSIVES REVIEW
SDG F52170

I-Holding Times and Preservation

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. For aqueous samples, explosive compounds are shipped @4°C ± 2°C, with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 8/29/07 were sent in 20 coolers, and were received by the laboratory on 8/30/07 at temperatures ranging from 0.8°C to 3.6°C, with 9 of the 20 coolers having temperatures below 2.0°C. The low sample temperatures are not expected to have an adverse impact on the analytical results. No qualifiers were applied.

- Holding Time Review: The samples were collected on 8/29/07, extracted on 9/4/07, analyzed for PETN and nitroglycerine on 9/7/07, and analyzed for all other explosives on 9/6/07 & 9/13/07. All criteria were met. No qualifiers were applied.

II-Blank Analysis

The purpose of laboratory or field blank analyses is to determine the existence and magnitude of contamination problems resulting from laboratory or field activities. One method blank per analytical batch must be run on each instrument used to analyze samples. No contaminants should be present in the blanks. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤5 times (5x) the maximum amount for explosive target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
9/6/07	OP22176-MB	All target explosives <½MRL	NA	NA	None
9/7/07	OP22176-MB	PETN & NG <½MRL	NA	NA	None
9/13/07	OP22176-MB	PETN & NG <½MRL	NA	NA	None
9/11/07	RB083007	All target explosives <½MRL	NA	NA	None
9/07/07	RB083007	PETN & NG <½MRL	NA	NA	None

MRL = Method Reporting Limit
NA = Not Applicable

III-Initial Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. The initial 5-point calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run. The DoD QSM specifies that the correlation coefficient (r^2) must be ≥0.990 and/or the percent relative standard deviation (%RSD) must be ≤20%. All detects were qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects were qualified as estimated "UJ" for where there were grossly exceeding recoveries. Grossly exceeding is defined as twice the established criteria limits.

- During the explosives initial calibration performed on 8/21/07 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

- During the PETN and nitroglycerine initial calibration performed on 03/15/07 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. Continuing calibration standards are analyzed after every 10 injections, and at the end of the analysis sequence. The DoD QSM specifies that the percent difference (%D) from initial calibration should be no greater than ±20%. All detects were qualified as estimated "J" for where there were exceeding %Ds, and all non-detects were qualified as estimated "UJ" for where there were grossly exceeding recoveries. Grossly exceeding is defined as twice the established criteria limits.

- During the explosives initial calibration verification performed on 8/21/07 @1716 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples were analyzed after this initial calibration verification.

- During the explosives continuing calibration verification performed on 9/6/07 @0242 on instrument G1315B, tetryl (24.5%) had a high %D from signal #1. All other target compounds met %D criteria. The method blank and LCS are the only analyses associated with this continuing calibration. No data qualifiers were applied.

- During the explosives continuing calibration verification performed on 9/6/07 @0824 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. All samples were analyzed following this continuing calibration.

- During the explosives continuing calibration verification performed on 9/6/07 @1407 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. All samples were analyzed prior to this continuing calibration.

- During the PETN and nitroglycerin initial calibration verification performed on 3/15/07 @1235 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples were analyzed in conjunction with this initial calibration verification.

- During the PETN and nitroglycerin continuing calibration performed on 9/7/07 @1242 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 59MW01, 48MW1, TMMW01, 48MW2, 48MW3, and TMMW3 were analyzed after this continuing calibration.

- During the PETN and nitroglycerin continuing calibration performed on 9/7/07 @1417 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 59MW01, 48MW1, TMMW01, 48MW2, 48MW3, and TMMW3 were analyzed prior to this continuing calibration, and sample 48MW4 was analyzed after this continuing calibration.

- During the PETN and nitroglycerin continuing calibration performed on 9/7/07 @1600 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples 48MW4 was analyzed after this continuing calibration.

- During the PETN and nitroglycerin continuing calibration performed on 9/13/07 @1031 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Sample 49MW01 was analyzed after this continuing calibration.

- During the PETN and nitroglycerin continuing calibration performed on 9/13/07 @1148 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Sample 49MW01 was analyzed prior to this continuing calibration.

V-System Monitoring Compound (Surrogates)
Laboratory performance on individual samples is established by means of spiking activities. The percent recovery (%R) for all samples and blanks must be within the laboratory control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Criteria: 3,4-dinitrotoluene (70-136%)

- All criteria were met for explosives, PETN, and nitroglycerin. No qualifiers were applied.

VI-Laboratory Control Sample
Laboratory control samples (LCS) are used to monitor long-term accuracy of the analytical method. The analysis is performed at a frequency of 1 per analytical batch. The percent recoveries (%Rs) must be within the laboratory control limits. DoD QSM aqueous LCS recovery limits are specified in Table D-12 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP22176-BS was used as the LCS for PETN, nitroglycerin, and explosives analysis. HMX (128%) had a high recovery, but no HMX was detected in any samples so no qualifiers were applied. All other compounds met recovery criteria. All samples were analyzed in conjunction with this LCS.

VII-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the laboratory control limits. DoD QSM aqueous MS/MSD recovery limits follow the LCS criteria and are specified in Table D-12 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample 48MW3 was used as the MS/MSD for the explosive analysis. 2,4-Dinitrotoluene (118%) had a high recovery in the MS, and tetryl (131%, 129%) had high recoveries in the MS and MSD. Neither compound was detected in any samples so no data qualification was required. PETN had a high RPD, but the MS and MSD recoveries met criteria, no action is taken on RPD alone. All other compounds met criteria. All samples were analyzed in conjunction with this MS/MSD.

VIII-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field duplicate pairs in this data set included 59MW01 & TMMW01, and 48MW3 & TMMW3. All explosives detected above the MDL met RPD criteria. No data qualifiers were applied.

IX-Quantitation Verification
The accuracy of analytical results was verified through the calculation of several parameters. The calculation was based calibration factors. The absolute percent difference (%D) between the calculated and the reported value must be within 10% difference. All values >MDL and <MRL or <3*MDL (whichever was greater) were qualified as estimated "J".

- The %D between the primary and secondary columns was within criteria for all detected explosives, PETN, and nitroglycerin.

Sample: OP22176-BS, HMX

Conc. µg/L = (Ax * Vt * DF) / (CF * Vs)

where: Conc. = Sample concentration in µg/L
Ax = Area of characteristic ion for compound being measured
Vt = Volume of total extract (mL)
DF = Dilution factor
CF = Average relative calibration factor for compound being measured (from ICAL)
Vs = Volume of sample extracted (mL)

Conc. µg/L = (1607036 * 10 * 1) / (3262 * 1000) = 4.9 µg/L

Reported Value = 4.9 µg/L
% Difference = 0.0%
Values were within 10% difference

Sample: OP22176-BS, nitroglycerin

Conc. µg/L = (Ax * Vt * DF) / (CF * Vs)

where: Conc. = Sample concentration in µg/L
Ax = Area of characteristic ion for compound being measured.
Vt = Volume of total extract (mL).
DF = Dilution factor
CF = Average relative calibration factor for compound being measured (from ICAL)
Vs = Volume of sample extracted (mL).

Conc. µg/L = (3361818 * 10 * 1) / (1228 * 1000) = 27.4 µg/L

Reported Value = 27.4 µg/L
% Difference = 0.0%
Values were within 10% difference

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I RFAAP Project Manager

FROM: Richard McCracken, Shaw E&I RFAAP Project Chemist

SUBJECT: Radford Army Ammunition Plant (RFAAP) Data Validation – Herbicides
Accutest Laboratories, Inc., SDG F52170

DATE: November 6, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on August 29, 2007. Aqueous samples were analyzed for chlorinated herbicides using USEPA SW846 Method 3510C/8151A. A total of eight aqueous samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
59MW01	F52170-1	48MW3	F52170-5
48MW1	F52170-2	TMMW3	F52170-6
TMMW01	F52170-3	48MW4	F52170-7
48MW2	F52170-4	49MW1	F52170-8

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times
	X	Initial Calibration
	X	Continuing Calibration
	X	Blank Analysis
	X	System Monitoring Compounds
	X	Laboratory Control Sample
	X	Matrix Spike/Spike Duplicate
	X	Field Duplicate
	X	Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable.

RFAAP VALIDATION REPORT
CHLORINATED HERBICIDES REVIEW
SDG F52170

I-Holding Times

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. For aqueous samples, chlorinated herbicides compounds are shipped @4°C ± 2°C, with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 8/29/07 were sent in 20 coolers, and were received by the laboratory on 8/30/07 at temperatures ranging from 0.8°C to 3.6°C, with 9 of the 20 coolers having temperatures below 2.0°C. The low sample temperatures are not expected to have an adverse impact on the analytical results. No qualifiers were applied.

- Holding Time Review: The samples were collected on 8/29/07, extracted on 9/1/07, and analyzed on 9/10/07. All criteria were met. No qualifiers were applied.

II-Initial Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The DoD QSM specifies that the percent relative standard deviation (%RSD) for a 5-point standard calibration should be ≤20% for each target compound.

- No initial calibration data was provided for MCPP or MCPA. During discussions with the laboratory, they indicated that they perform a one-point calibration each day that analysis for MCPP or MCPA is conducted. A five-point initial calibration was not performed, therefore all data for these two compounds has been qualified "J/UJ".

- During the initial calibration performed on 9/9/07 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

III-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Continuing calibration establishes the response factors on which the quantitations are based and checks satisfactory performance of the instrument on a day-to-day basis. The DoD QSM specifies that the percent difference (%D) between the initial calibration CF and the continuing calibration CF must be ≤20%.

- A one-point daily calibration was provided for MCPP and MCPA, indicating that the lab is able to detect and quantitate both compounds. %D data was not supplied since a five-point initial calibration was not performed. All MCPP and MCPA data has already been qualified (see initial calibration), no additional qualification is required.

- During continuing calibration performed on 9/10/07 @0136 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. All samples were analyzed following this continuing calibration.

- During continuing calibration performed on 9/10/07 @0750 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. All samples were analyzed following this continuing calibration.

- During continuing calibration performed on 9/10/07 @1424 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. All samples were analyzed prior to this continuing calibration.

IV-Blank Analysis

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field or laboratory activities. No contaminants should be detected in any of the associated blanks. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are qualified "B" if the concentration of the analyte is ≤ five times (5x) the absolute maximum blank concentration. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
9/10/07	OP7992-MB	All target compounds <½MRL	NA	NA	None
9/10/07	RB083007	All target compounds <½MRL	NA	NA	None

V-System Monitoring Compounds (Surrogates)

Laboratory performance on individual samples is established by means of spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. Spike recoveries must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Control Limit: 2,4-DCAA (34-179%)

- All samples met recovery criteria.

VI-Laboratory Control Samples

Data for laboratory control samples (LCS) are generated to determine long-term precision and accuracy of the analytical method. Percent recoveries must be within the specified control limits. DoD QSM aqueous LCS recovery limits are specified in Table D-8 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP7992-BS was used as the LCS during the 9/10/07 run. 2,4,5-T (115%) and dicamba (115%) had high recoveries, but neither compound was detected in any samples so no qualifiers were applied. All other herbicides were within criteria. All samples were analyzed in conjunction with this LCS.

VII-Matrix Spike/Matrix Spike Duplicate

Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD QSM aqueous MS/MSD recovery limits follow the LCS criteria and are specified in Table D-8 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- MS/MSD analysis was performed on 48MW3. 2,4,5-TP (Silvex) (121%, 118%) had high recoveries in the MS and MSD, and 2,4,5-T (111%) had a high recovery in the MS - neither compound was detected in any samples so no qualifiers were applied. Dinoseb had a high RPD, but the recoveries in the MS & MSD met criteria - no action is taken on RPD data alone. All other herbicides met recovery and RPD criteria.

VIII-Field Duplicate Sample Analysis

Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were qualified because of blank contamination (B-qualified) or were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field duplicate pairs in this data set included 59MW01 & TMMW01, and 48MW3 & TMMW3. All herbicides detected above the MDL met RPD criteria. No data qualifiers were applied.

IX-Quantitation Verification

The accuracy of analytical results is verified through the calculation of several parameters. Percent difference (%D) between the calculated value and the reported value must be within 10%. All positive values must have less than or equal to 40% %D between the primary and secondary columns. Any sample value >MDL and <MRL is qualified as estimated, "J." All criteria were met. No qualifiers were applied.

- The %D between the primary and secondary columns was within criteria for all detected chlorinated herbicides.

Sample: OP7992-BS, 2,4,5-TP (Silvex)

Conc. µg/L = (A * DF * Vt) / (CF * Vo)

where: A = Area response of the sample
CF = Calibration Factor from initial calibration (area/(ug/L))
Vt = volume of final extract (mL)
DF = dilution factor
Vo = volume of the sample extracted (mL)

Conc. µg/L = (3796785 * 1 * 10 mL) / (83090 * 1000 mL)
= 0.46 ng/mL = 0.46 µg/L

Reported Conc. = 0.46 µg/L
%D = 0.0%
Values were within 10% difference

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

A (Dioxins) = MDL is based upon the signal-to-noise measurement.

B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics and Dioxins) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

D (Organics) = Indicates sample was analyzed at a dilution.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

E (Dioxins) = Reported value is estimated because of the presence of ether interferences.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/F ions is outside accepted ranges. The detected PCDD/F is reported as an estimated maximum possible concentration (EMPC).

I (Dioxins) = Reported value is estimated because of the incorrect isotope rations were obtained.

J (All) = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, (2) estimating a concentration <MRL and ≥ MDL, or estimating a concentration below the calibration range.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

U (All) = ND = BQL = Not detected. The associated number indicates the compound reporting limit for the sample.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – TAL Metals
Accutest Laboratories, Inc., SDG F52170

DATE: November 6, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on August 29, 2007. The samples were analyzed for target analyte list (TAL) metals using USEPA SW-846 3010A/6010B for ICP metals and SW-846 7470A for mercury. A total of eight aqueous samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
59MW01	F52170-1	48MW3	F52170-5
48MW1	F52170-2	TMMW3	F52170-6
TMMW01	F52170-3	48MW4	F52170-7
48MW2	F52170-4	49MW1	F52170-8

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Inorganic Data Review* (April, 1993). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times
X		Initial and Continuing Calibration
X		Blank Analysis
	X	ICP Interference Check Sample (ICS)
	X	Laboratory Control Sample (LCS)
	X	Laboratory Sample Duplicate
	X	Matrix Spike and Spike Duplicate
	X	ICP Serial Dilution
	X	Field Sample Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Richard McCracken, Chemist

RFAAP VALIDATION REPORT
METALS REVIEW
SDG F52170

I-Holding Times

The primary objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample analysis. Holding time criteria: For aqueous matrices, the samples are shipped cool @4°C±2°C and preserved to pH<2 with HNO_3 with a maximum holding time is 180 days for ICP metals and 28 days for mercury.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 8/29/07 were sent in 20 coolers, and were received by the laboratory on 8/30/07 at temperatures ranging from 0.8°C to 3.6°C, with 9 of the 20 coolers having temperatures below 2.0°C. The low sample temperatures are not expected to have an adverse impact on the analytical results. No qualifiers were applied.

- Holding Time Review: The samples were collected 8/29/07 for metals analysis, digested for mercury on 9/5/07, analyzed for mercury on 9/5/07, digested for ICP metals on 9/12/07 & 9/14/07, and analyzed for ICP metals on 9/13/07 & 9/17/07. All criteria were met. No qualifiers were applied.

II-Initial and Continuing Calibration

Requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable quantitative data. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of the analysis run, and continuing calibration verification documents that the initial calibration is still valid.

ICP:	1- blank (DoD QSM <½ MRL) 3 – standards (r≥0.995) ICV/CCV (90-110%) (DoD QSM 90-110%) MRL (70-130%) (DoD QSM 80-120%) High Std. (95-105%)	Hg:	1 – blank (DoD QSM <½ MRL) 5 – standards (r≥0.995) ICV/CCV (80-120%)(DoD QSM ICV 90-110% & CCV 80-120%) MRL (80-120%) (DoD QSM 80-120%) High Std. (95-105%)

- Mercury analysis was performed on 9/5/07, with a correlation coefficient of 0.9999.

- CCV20, CCV21, CCV22, and CCV23 from 9/12/07 had low nickel (88.0%, 89.0%, 88.5%, 88.5%) recoveries, but no samples from this data set were analyzed on 9/12/07 so no data qualifiers were applied. All CCVs from 9/13 & 9/17 met criteria.

- Aluminum (105.5%) and sodium (108.1%) had a high recoveries during the High Standard analysis on 9/12/07. No field samples were analyzed on 9/12/07, no data qualifiers were applied.

- All metals met recovery criteria during the 9/13/07 High Standard analysis.

- Calcium (94.3%) and iron (94.0%) had low recoveries, and sodium (106.3%) had a high recovery during the 9/17/07 High Standard analysis. The calcium and iron results have been qualified "L/UL", and the sodium detections have been qualified "K" in associated samples 48MW3, TMMW3, 48MW4, and 49MW01.

- All ICVs and CCVs met recovery criteria. **Table 2** summarizes the MRL standard analysis. Samples with concentrations detected less than two times the MRL with out of criteria MRL recovery were qualified.

Table 2 MRL Analysis Summary

Analysis Date	Analysis	MRL (µg/L)	MRL %Recovery	Qualified samples @ <2xMRL	Validation Qualifiers
9/5/07	Hg	0.2	Met criteria	None	None
9/12/07	ICP-Sb	5.0	124.0	None	None
9/12/07	ICP-As	10	122.0	None	None
9/12/07	ICP-Pb	5.0	130.0	None	None
9/13/07	ICP-Sb	5.0	122.0	None	None
9/17/07	ICP-Sb	5.0	130.0	None	None
9/17/07	ICP-Be	5.0	122.0	None	None
9/17/07	ICP-Pb	5.0	136.0	48MW3, 48MW4	K
9/17/07	ICP-Se	10	130.0	None	None
9/17/07	ICP-Tl	10	76.0	48MW3, TMMW3, 48MW4, 49MW01	UL

III-Blanks

Blanks (preparation and calibration blanks) are assessed to determine the existence and magnitude of contamination problems. No contaminants should be detected (i.e. <MDL) in any of the associated blanks. DoD QSM limits are <½MRL for the method blank and <2*MDL for the calibration blanks. Samples are qualified "B" when they are less than 5x the absolute value of the maximum blank concentration. **Table 3** summarizes the blank contamination analysis.

Table 3 Blank Contamination Analysis Summary

Analysis Date	Analysis	QC Blank ID	Max Conc. µg/L	Action Level µg/L	B qualified samples
9/13/07	Antimony	ICB/CCBs	12.0	60.0	None
9/13/07	Potassium	ICB/CCBs	457 J	2285	59MW01, 48MW1, TMMW01
9/17/07	Antimony	ICB/CCBs	7.7	38.5	None
9/17/07	Copper	ICB/CCBs	5.4 J	27.0	None
9/17/07	Potassium	ICB/CCBs	1710 J	8550	All
9/17/07	Sodium	ICB/CCBs	1860 J	9300	48MW3, TMMW3
9/5/07	Mercury	ICB/CCBs	<2*MDL	NA	None
9/5/07	Mercury	MP12873-MB	<½MRL	NA	None
9/14/07	Lead	MP12936-MB	3.0 J	15.0	48MW3, 48MW4
9/17/07	Potassium	RB083007	1740 J	8700	All
9/17/07	Sodium	RB083007	1860 J	9300	48MW3, TMMW3
09/05/07	Mercury	RB083007	<2*MDL	NA	None

J = Estimated value <MRL and >MDL.

IV-ICP Interference Check Sample (ICS)

The ICP interference check sample (ICS) verifies interelement and background correction factors. ICP Interference Check is performed at the beginning and end of each sample analysis run. Control limits are 80-120% (DoD QSM limits 80-120%).

- All criteria were met. No qualifiers were applied.

V-Laboratory Control Samples (LCS)

The laboratory control sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. All aqueous LCS results must fall within the control limits. The DoD QSM aqueous LCS recovery limits are specified in Table D-18 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample MP12936-BS was used as the LCS during ICP metals analysis. All criteria were met. No qualifiers were applied. All samples were analyzed in conjunction with this LCS.

- Sample MP12873-BS was used as the LCS during mercury analysis. All criteria were met. No qualifiers were applied. All samples were analyzed in conjunction with this LCS.

VI-Laboratory Duplicate Sample Analysis
Duplicate sample determinations are used to demonstrate acceptable method precision by the laboratory at the time of analysis. Duplicate analyses are also performed to generate data in order to determine the long-term precision of the analytical method on various matrices. RPDs must be within established control limits. DoD QSM limits for metals are 20% RPD for ICP metals and mercury.

- Sample 48MW3 was analyzed in duplicate during ICP metals analysis. All metals met RPD criteria. No data qualifiers were applied.

- Sample 48MW3 was used analyzed in duplicate during mercury analysis, and met RPD criteria. No qualifiers were applied.

VII-Matrix Spike/Spike Duplicate
MS/MSD are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. Specific criteria include the analyses of matrix spike and matrix spike duplicate samples at a frequency of one MS and MSD per 20 samples of similar matrix. MS and MSD recoveries and relative percent differences between MS and MSD recoveries should be within the specified limits. DoD QSM aqueous MS/MSD recovery limits follow the LCS criteria and are specified in Table D-18 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used. Post digestion spikes limits are 75-125% for ICP metals and mercury.

- Sample 48MW3 was used as the MS/MSD during ICP metals analysis. All metals met recovery and RPD criteria. No data qualifiers were applied.

- Sample 48MW3 was used as the MS/MSD during mercury analysis, and met recovery & RPD criteria. No data qualifiers were applied.

VIII-ICP Serial Dilution
An ICP serial dilution is performed to determine whether significant physical or chemical interferences exist due to sample matrix at high concentrations. An analysis of a 5-fold dilution should agree within 10% difference of the original result when the concentration in sample is a factor of 50 above MDL.

- Sample 48MW3 was used as the serial dilution during ICP metals analysis. All metals met criteria. No data qualifiers were applied.

IX-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 35% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field duplicate pairs in this data set included 59MW01 & TMMW01, and 48MW3 & TMMW3. All metals detected above the MDL met RPD criteria. No data qualifiers were applied.

X-Quantitation Verification
The accuracy of analytical results is verified through the calculation of several parameters. The percent difference (%D) between the calculated and the reported values should be within 10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J." The following calculations were performed for verification.

ICP Sample: 59MW01, Manganese

Conc. (µg/L) = (conc. µg/L) *(Final Volume mL) * (DF) / (Volume Sample mL)

Conc. (µg/L) = (20.5 µg/L)*(50 mL)*(1) / (50 mL) = 20.5 µg/L

Reported concentration = 20.5 µg/L
%D = 0.0%
Values were within 10% difference.

CVAA Sample: 48MW3 MSD, Mercury

Conc. (µg/L) = (conc. µg/L) *(Final Volume mL) * (DF) / (Volume Sample mL)

Conc. (µg/L) = (2.88 µg/L)*(50 mL)*(1) / (50 mL) = 2.9 µg/L

Reported concentration = 2.9 µg/L
%D = 0.0%.
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

D = Indicates sample was analyzed at a dilution.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

N (Metals) = Laboratory spike sample recovery not within control limits.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Perchlorate
Datachem Laboratories, Inc. SDG 07E-0785-01
(Accutest Laboratories, Inc., SDG F52170)

DATE: November 7, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP August 29, 2007. The aqueous samples were analyzed for perchlorate analysis using liquid chromatography mass spectroscopy (LC/MS) SW-846 method LC-MS-CLO4/6850 in selective ion monitoring (SIM) mode. A total of eight aqueous samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
59MW01	F52170-1	48MW3	F52170-5
48MW1	F52170-2	TMMW3	F52170-6
TMMW01	F52170-3	48MW4	F52170-7
48MW2	F52170-4	49MW1	F52170-8

Data were reviewed and validated using a combination of project QAPP, *DOD Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006), *DoD Perchlorate Handbook August, Rev1, Change 1, 2007* (DoD, 2007), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Inorganic Data Review* (April, 1993). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Instrument Performance Check
X		Initial and Continuing Calibration
	X	Blank Analysis
	X	Internal Standards
	X	Laboratory Control Sample (LCS)
	X	Matrix Spike (MS) and Spike Duplicate (MSD)
	X	Field Duplicate
	X	Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Richard McCracken, Chemist

Date

RFAAP VALIDATION REPORT
PERCHLORATE REVIEW
SDG 07E-0785-01 (F52170)

I-Holding Times and Preservation

The primary objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample analysis. For perchlorate analysis, aqueous samples are shipped and stored at @4°C±2°C with a maximum holding time of 28 days from collection (DoD Perchlorate Handbook criteria).

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 8/29/07 were sent in 20 coolers, and were received by the laboratory on 8/30/07 at temperatures ranging from 0.8°C to 3.6°C, with 9 of the 20 coolers having temperatures below 2.0°C. The low sample temperatures are not expected to have an adverse impact on the analytical results. Accutest shipped the perchlorate aliquot to DataChem Laboratories on 8/30/07, they were received by DataChem on 8/31/07 at 4°C. No qualifiers were applied.

- Holding Time Review: The aqueous samples were collected on 8/29/07, prepped on 9/18/07, and analyzed on 9/18/07. All holding time criteria were met. No qualifiers were applied.

II-Instrument Performance Check

LC/MS instrument performance checks are performed to ensure mass resolution, identification and, to some degree, sensitivity. The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed.

- The instrument performance check target compounds - $^{35}Cl^{16}O_3$, $^{37}Cl^{16}O_3$, and $^{35}Cl^{18}O_3$ - met the mass calibration criteria. No qualification was applied.

III-Initial and Continuing Calibration

Requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable quantitative data. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of the analysis run, and continuing calibration verification documents that the initial calibration is still valid.

Perchlorate:	1- blank (<1/2MRL DoD Perchlorate Handbook)
	5 – standards (r≥0.995 DoD Perchlorate Handbook)
	ICV (±15%D DoD Perchlorate Handbook)
	CCV (±15%D DoD Perchlorate Handbook)
	ICS, LODV (±30%D DoD Perchlorate Handbook)

- The perchlorate samples were analyzed on 9/18/07.

- Perchlorate was calibrated using a second order equation on 9/18/07, and had a correlation coefficient of 0.9998.

- The perchlorate recovery in LODV2 (74.2%) was above criteria, which the lab attributed to a positive interference at m/z 83. The eight samples in this data set were analyzed between LODV1 and LODV2, and the perchlorate results from all samples have been qualified "J/UJ" as estimated.

- All other ICVs, CCVs, ICSs, and LODVs were within criteria.

IV-Blanks

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. One method blank per analytical batch must be run on each instrument used to analyze samples. No contaminants should be detected in any of the associated blanks >MDL. The DoD Perchlorate Handbook criterion specifies all concentrations should be less than ½ MRL for method blanks. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤5 times (5X) the maximum amount for target compounds. **Table 2** summarizes the blank contamination analysis. Action levels are based upon dilution factor of one.

Table 2 Blank Contamination Analysis Summary

Analysis Date	Analysis	QC Blank ID	Max Conc. µg/L	Action Level µg/L	B qualified samples
9/18/07	Perchlorate	BL-259711-1	<½MRL	NA	None
9/18/07	Perchlorate	RB083007	<½MRL	NA	None

MRL = Method Reporting Limit.
NA = Not Applicable.

V-Internal Standards

Internal standard performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Internal standard area counts for samples and blanks must not vary by more than a factor of two (-50% to +100%) from the associated calibration standard. The DoD Handbook specifies relative retention times (RRT) of 1.0 ± 2% of last calibration standard. The mass ratio of ions 83:85 for each sample and standard should be 3.06, and must fall between 2.3 and 3.8 to confirm the presence of perchlorate. The laboratory 83:85 mass ratio limit range is 2.21 to 4.10.

- LODV1 and LODV3 did not meet the 83:85 mass ratio criteria, but all eight samples and the associated MS/MSD met the 83:85 mass ratio criteria. No data qualifiers were applied.

- All samples met area and RRT criteria, and all samples other than the three listed above met 83:85 mass ratio criteria.

VI-Laboratory Control Samples (LCS)

The laboratory control sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. DoD Perchlorate Handbook and laboratory aqueous limits are 85-115%.

- Sample QC-259711-1 was used as the aqueous LCS for perchlorate analysis on 9/18/07. All criteria were met. No qualifiers were applied.

VII-Matrix Spike (MS) and Spike Duplicate (MSD)

MS and MSD are generated to determine long-term accuracy and precision of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. Specific criteria include the analyses of matrix spike samples at a frequency of one MS/MSD per 20 samples of similar matrix. MS/MSD recoveries and relative percent differences between MS recoveries should be within the specified limits. DoD Perchlorate Handbook aqueous limits are 75-125%; RPD≤20%. The laboratory limits are 80-120%; RPD≤15%.

- Sample 48MW03 (F52170-5) was used for the MS/MSD analysis. All criteria were met. All samples were analyzed in conjunction with this MS/MSD.

VIII-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field duplicate pairs in this data set included 59MW01 (F52170-1) & TMMW01 (F52170-3), and 48MW3 (F52170-5) & TMMW3 (F52170-6). All compounds detected above the MDL met RPD criteria. No data qualifiers were applied.

IX-Quantitation Verification
The accuracy of analytical results is verified through the calculation of several parameters. The percent difference (%D) between the calculated and the reported values should be within 10%. Any sample value >MDL and <MRL or <3*MDL (whichever was greater) was qualified as estimated, "J." The following calculations were performed for verification.

Sample: TMMW3 (F52170-6, 07E04505), Perchlorate

y (area ratio) = (Sample Area/Area EIC89) = (6924.26/49747.7) = 0.1392 = ax^2 + bx + c

solve for x
x = [-b ± SQRT(b^2-4ac)] / (2a)

where: x is the amount ratio

a = 0.0225735 b = 1.36878 c = - 0.0186592 - 0.1392 = -0.15786

amount ratio ={-1.36878± [SQRT{(1.36878^2) – (4*0.0225735*-0.15786)}] / (2*0.0225735)
={-1.36878± [SQRT (1.8735587+0.014254)]}/0.045147
={-1.36878±[SQRT 1.887813]} / 0.045147
={ -1.36878±1.37398 }/0.045147
=0.1152

Conc. µg/L = (Amount ratio * Is * DF)

where: Conc. = Sample concentration in ug/L
I_s = Amount of internal standard (µg/L).
DF = Dilution factor

Conc. µg/L = (Amount ratio * Is * DF)
= (0.1152* 5 µg/L * 1) = 0.576 µg/L

Reported concentration = 0.576 µg/L
%D = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

Shaw® Shaw Environmental, Inc.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Pesticides and PCBs
Accutest Laboratories, Inc., SDG F52170

DATE: November 6, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on August 29, 2007. Samples were analyzed for pesticides and PCBs using USEPA Methods 510C/8081A and 3510C/8082, respectively. A total of eight aqueous samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
59MW01	F52170-1	48MW3	F52170-5
48MW1	F52170-2	TMMW3	F52170-6
TMMW01	F52170-3	48MW4	F52170-7
48MW2	F52170-4	49MW1	F52170-8

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Instrument Performance Check
	X	Initial Calibration
X		Continuing Calibration
	X	Blank Analysis
X		System Monitoring Compounds
X		Laboratory Control Samples
X		Matrix Spike/Spike Duplicate
	X	Field Duplicate
	X	Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Richard M. Cracken

Richard McCracken, Chemist

11/6/07

Date

RFAAP VALIDATION REPORT
PESTICIDE/PCB REVIEW
SDG F52170

I-Holding Times and Preservation
The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. For aqueous samples, pesticide and PCB compounds are shipped @4°C ± 2°C, with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 8/29/07 were sent in 20 coolers, and were received by the laboratory on 8/30/07 at temperatures ranging from 0.8°C to 3.6°C, with 9 of the 20 coolers having temperatures below 2.0°C. The low sample temperatures are not expected to have an adverse impact on the analytical results. No qualifiers were applied.

- Holding Time Review: The samples were collected on 8/29/07, extracted for pesticides and PCBs on 9/4/07, analyzed for pesticides on 9/17/07 & 9/18/07, and analyzed for PCBs on 9/19/07. All criteria were met. No qualifiers were applied.

II-Instrument Performance Check (Degradation Standard)
Performance checks on the gas chromatograph with electron capture detector (GC/ECD) system are performed to ensure adequate resolution and instrument sensitivity. The performance evaluation mixture (PEM) must be analyzed at the beginning of the analytical sequence. The breakdown of Endrin and 4,4'-DDT must be ≤15% on both signals.

- During analysis performed on 9/13/07 @1124, endrin and 4,4'-DDT percent breakdowns were 7.5% and 3.3% on signal #1, and 6.8% and 2.7% on signal #2, respectively. All criteria were met. No qualifiers were applied.

- During analysis performed on 9/17/07 @1541, endrin and 4,4'-DDT percent breakdowns were 8.6% and 11.3% on signal #1, and 8.2% and 9.8% on signal #2, respectively. All criteria were met. No qualifiers were applied.

III-Initial Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. The initial 5 point calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run. Calibration factors are generated for each compound. The DoD QSM specifies that the percent relative standard deviation (%RSD) for all single peak target analytes, and aroclors 1016, 1242, 1254, and 1260 must be <20% or the mean %RSD for all analytes in the standard must be ≤20%. If linear regression is used, the correlation coefficient must be ≥0.990. All detects are qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits.

- During the pesticide initial calibration performed on 9/13/07 on instrument ECD6, all criteria were met. No qualifiers were applied. All samples were analyzed following this initial calibration.

- During the PCB initial calibration performed on 9/17/07 on instrument ECD3, all criteria were met. No qualifiers were applied. All samples were analyzed following this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for pesticide/PCB target compounds. Continuing calibration standards containing both target compounds and surrogates are analyzed at the beginning of each 12-hour analytical shift and after every 20 samples. The DoD QSM specifies that the percent difference (%D) or the average %Ds for all analytes in the standard from the calibration should be no greater than ±20%.

- During the pesticide initial calibration verification performed on 9/13/07 @1346 on instrument ECD6, all criteria were met. No qualifiers were applied. No samples were analyzed in conjunction with this ICV.

- During the pesticide continuing calibration performed on 9/17/07 @2040 on instrument ECD6, all criteria were met. No qualifiers were applied. Samples 59MW01, 48MW1, TMMW01, 48MW2, and 48MW3 were analyzed after this continuing calibration.

- During the pesticide continuing calibration performed on 9/17/07 @2318 on instrument ECD6, endrin ketone (20.8%) had a high %D on signal #2. All endrin ketone results in associated samples have been qualified "J/UJ". All other compounds met criteria. Samples 59MW01, 48MW1, TMMW01, 48MW2, and 48MW3 were analyzed prior to this continuing calibration, while samples TMMW3, 48MW4, and 49MW01 were analyzed after to this continuing calibration.

- During the pesticide continuing calibration performed on 9/18/07 @0036 on instrument ECD6, all criteria were met. No qualifiers were applied. Samples TMMW3, 48MW4, and 48MW01 were analyzed prior to this continuing calibration.

- During the PCB 1016/1260 initial calibration verification performed on 9/17/07 @1518 on instrument ECD3, all criteria were met. No qualifiers were applied. No samples were analyzed following this initial calibration verification.

- During the PCB 1016/1260 continuing calibration performed on 9/19/07 @1156 on instrument ECD3, all criteria were met. No qualifiers were applied. Samples 59MW01, 48MW1, TMMW01, and 48MW2 were analyzed after this continuing calibration.

- During the PCB 1016/1260 continuing calibration performed on 9/19/07 @1509 on instrument ECD3, aroclor 1016 peak #1 had high %D on signal #1 (22.3%) and signal #2 (23.2%). The average %D from all six peaks was < 20% on signal #1 (9.0%) and signal #2 (9.3%), so no qualifiers were applied. The aroclor 1260 peaks met criteria. Samples 59MW01, 48MW1, TMMW01, and 48MW2 were analyzed prior to this continuing calibration, while samples 48MW3, TMMW3, 48MW4, and 49MW01 were analyzed after this continuing calibration.

- During the PCB 1016/1260 continuing calibration performed on 9/19/07 @1734 on instrument ECD3, aroclor 1016 peak #1 had high %D on signal #1 (25.5%) and signal #2 (24.8%). The average %D from all six peaks was < 20% on signal #1 (11.0%) and signal #2 (9.9%), so no qualifiers were applied. The aroclor 1260 peaks met criteria. Samples 48MW3, TMMW3, 48MW4, and 49MW01 were analyzed prior to this continuing calibration.

V-Blank Analysis

The purpose of laboratory or field blank analyses is to determine the existence and magnitude of contamination problems resulting from laboratory or field activities. One method blank per analytical batch must be run on each instrument used to analyze samples. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤5 times (5X) the maximum amount for pesticide and PCB target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Parameter	Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
Pesticides	9/17/07	OP22191-MB	All target <½MRL	NA	NA	None
Pesticides	9/24/07	RB083007	All target <½MRL	NA	NA	None
PCBs	9/19/07	OP22188-MB	All target <½MRL	NA	NA	None
PCBs	9/14/07	RB083007	All target <½MRL	NA	NA	None

NA = Not Applicable
MRL = Method Reporting Limit

VI-System Monitoring Compound (Surrogates)
Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Surrogate spikes are added to all samples and blanks to measure their recovery in sample and blank matrices. The percent recoveries (%Rs) must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Criteria:	Tetrachloro-m-xylene:	Pesticides: 42-127% (DoD QSM 25-140%)
	Decachlorobiphenyl:	Pesticides: 27-127% (DoD QSM 30-135%)
	Tetrachloro-m-xylene:	PCBs: 38-127% (DoD QSM Not Listed)
	Decachlorobiphenyl:	PCBs: 25-137% (DoD QSM 40-135%)

- Sample 48MW2 had a low decachlorobiphenyl recovery (29.2%) from signal #2 during pesticide analysis. Decachlorobiphenyl met recovery criteria on signal #1, and tetrachloro-m-xylene was within criteria on both signals. No qualifiers are required when only one surrogate is outside criteria from one signal.

- All other samples met surrogate recovery criteria during pesticide analysis.

- Sample 48MW2 had low decachlorobiphenyl recoveries (28.7%, 29.6%) from both signals during PCB analysis. The PCB results from 48MW2 have been qualified "J/UJ" as estimated.

- All other samples met surrogate recovery criteria during PCB analysis.

VII-Laboratory Control Samples
Laboratory control samples (LCS) are used to monitor laboratory accuracy by calculating the percent recoveries of the spiked compounds. All LCS percent recoveries must be within the specified control limits. DoD QSM aqueous LCS recovery limits are specified in Table D-14 and Table D-16 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP22191-BS was used as the LCS during 9/17/07 pesticide analysis. Endrin aldehyde (24%) had a low recovery, and was not detected in any field samples – the results have been qualified "UL" as estimated. All other pesticides met recovery criteria.

- Sample OP22188-BS was used as the LCS during the 9/19/07 PCB analysis. All criteria were met. No qualifiers were applied.

VIII-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD aqueous MS/MSD recovery limits follow the LCS criteria and are specified in Table D-14 and Table D-16 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample 48MW3 was used for the pesticide MS/MSD analysis. Endrin aldehyde (20%, 27%) had a low recovery in the MS and MSD, as well as having a low recovery in the associated LCS. All sample results have already been qualified "UL", no further qualification is required. All other pesticides met criteria. All samples were analyzed in conjunction with this MS/MSD.

- Sample 48MW3 was used for the PCB MS/MSD analysis. All criteria were met. No qualifiers were applied. All samples were analyzed in conjunction with this MS/MSD.

IX-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field duplicate pairs in this data set included 59MW01 & TMMW01, and 48MW3 & TMMW3. All pesticides detected above the MDL met RPD criteria. No data qualifiers were applied.

X-Quantitation Verification
The accuracy of analytical results was verified through the calculation of several parameters. The difference between the calculated value and the reported value must be within 10% difference. All positive values must have less than or equal to 40% %D between the primary and secondary columns. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J." All criteria were met.

Sample: 48MW3MSD, dieldrin

Conc. µg/L = (Ax * Vt * DF) / (CF * Vi * Vs *1000)

where: Ax = Area response for the compound being measured
Vt = Total volume of extract, taking into account dilutions (uL)
DF = Dilution factor
CF = Calibration Factor from initial calibration (area/pg)
Vi = Volume of extract injected (uL)
Vs = Volume of the sample extracted (mL)

Conc. µg/L = (2737226 * 1 * 10000) / (48810 * 520 * 1 * 1000)
= 1.1 ng/mL = 1.1 ug/L

Reported Conc. = 1.1 µg/L
%D = 0.0%
Values were within 10% difference

Sample: 48MW3MS, Aroclor 1260

Conc. µg/L = (Ax * Vt * DF) / (CF * Vi * Vs * 1000)

where: Conc. = Sample concentration in µg/L
Ax = Area response for compound being measured.
Vt = Total volume of extract, taking into account dilutions (µL)
DF = Dilution factor
CF = Calibration factor from ICAL (area/pg)
Vi = Volume of extract injected (µL).
Vs = Volume of sample extracted (mL).

Signal #1
Conc1 µg/L = (3361004 * 10000* 1) / (8730 * 1 * 510 * 1000) = 7.55 µg/L
Conc2 µg/L = (3706286 * 10000* 1) / (10130 * 1 * 510 * 1000) = 7.17 µg/L
Conc3 µg/L = (4017626 * 10000* 1) / (10500 * 1 * 510 * 1000) = 7.50 µg/L
Conc4 µg/L = (2901174 * 10000* 1) / (7745 * 1 * 510 * 1000) = 7.34 µg/L
Conc5 µg/L = (6662020 * 10000* 1) / (18130 * 1 * 510 * 1000) = 7.20 µg/L
Conc6 µg/L = (3693262 * 10000* 1) / (10080 * 1 * 510 * 1000) = 7.18 µg/L
Average concentration = 7.3 µg/L

Reported Value = 7.3 µg/L (from signal #1)
% Difference = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

N (Metals) = Laboratory spike sample recovery not within control limits.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

Shaw® Shaw Environmental, Inc.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Semi-Volatiles & Polynuclear Aromatic Hydrocarbons Accutest Laboratories, Inc., SDG F52170

DATE: November 5, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on August 29, 2007. Samples were analyzed for semivolatile organic compounds (SVOCs) using USEPA SW846 Methods 3510C/8270C. The polynuclear aromatic hydrocarbons (PAHs) were analyzed using selective ion monitoring (SIM) techniques. A total of eight aqueous samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
59MW01	F52170-1	48MW3	F52170-5
48MW1	F52170-2	TMMW3	F52170-6
TMMW01	F52170-3	48MW4	F52170-7
48MW2	F52170-4	49MW1	F52170-8

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Instrument Performance Check
	X	Initial Calibration
	X	Continuing Calibration
	X	Blank Analysis
	X	Surrogate Spikes
	X	Internal Standards
	X	Laboratory Control Sample
	X	Matrix Spike/Spike Duplicate
	X	Field Duplicate
	X	Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable.

Richard McCracken, Chemist

RFAAP VALIDATION REPORT
SEMIVOLATILES AND PAH REVIEW
SDG F52170

I-Holding Times and Preservation
The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: For semivolatile (SVOC) and polynuclear aromatic hydrocarbons (PAH) compounds, the samples are cooled @4°C ± 2°C for aqueous samples with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 8/29/07 were sent in 20 coolers, and were received by the laboratory on 8/30/07 at temperatures ranging from 0.8°C to 3.6°C, with 9 of the 20 coolers having temperatures below 2.0°C. The low sample temperatures are not expected to have an adverse impact on the analytical results. No qualifiers were applied.

- Holding Time Review: The aqueous samples were collected on 8/29/07, extracted for SVOCs on 9/5/07, extracted for PAHs by SIM on 9/5/07, analyzed for SVOCs on 9/11/07 & 9/12/07, and analyzed for PAHs by SIM on 9/21/07. All criteria were met. No qualifiers were applied.

II-Instrument Performance Check
GC/MS instrument performance checks are performed to ensure mass resolution, identification and, to some degree, sensitivity. The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed.

- The instrument performance check, decafluorotriphenylphosphine (DFTPP), met the ion abundance criteria. No qualification was applied.

III-Initial Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for compounds on the semivolatile target compound list (TCL). Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. For compounds analyzed using linear regression or second order, correlation coefficients must be >0.995 and coefficients of determination >0.99. The minimum relative response factor (RRF) criteria must be ≥0.05. The DoD QSM specifies that the initial calibration percent relative standard deviation (%RSD) must be ≤15% on the average for all compounds (<30% for CCCs). All detects are qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- Initial calibration for the SVOCs was performed on 9/11/07 using instrument GCMSU. Target compounds 2,4-dinitrophenol (45.04%) and 4,6-dinitro-2-methylphenol (21.03%) had %RSDs outside criteria. All other target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). The compounds with high %RSD were quantified using second order regression, and had correlation coefficients >0.995; therefore no qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

- Initial calibration for the PAHs-SIM was performed on 9/20/07 using instrument GCMSW, all target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). No qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used was capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Continuing calibration standards containing both target and surrogates compounds are analyzed at the beginning of each 12-hour analysis period following the analysis of the instrument performance check and prior to the analysis of blanks and samples. The minimum relative response factors (RRF) for semivolatile target compounds and surrogates must be ≥0.05. The DoD QSM specifies that the percent difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within ±20% for all target compounds. Grossly exceeding is defined where %D>40%. All detects are qualified as estimated "J" for where there were exceeding %Ds, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- During the SVOC initial calibration verification performed on 9/11/07 @1630 using instrument GCMSU, bis(2-chloroethoxy)methane (24.5%), 4-chloroaniline (34.3%), and 3-nitroaniline (29.7%) had %D outside criteria. All other target compounds met criteria. No samples were analyzed following this initial calibration verification, no qualifiers were applied.

- During the SVOC continuing calibration performed on 9/11/07 @1741 using instrument GCMSU, all criteria were met for all target compounds. No qualifiers were applied. All samples were analyzed following this continuing calibration.

- During the PAH-SIM initial calibration verification performed on 9/20/07 @1643 using instrument GCMSW, all criteria were met for all target compounds. No qualifiers were applied. No samples were analyzed following this initial calibration verification.

- During the PAH-SIM continuing calibration performed on 9/20/07 @1811 using instrument GCMSW, all criteria were met for all target compounds. No qualifiers were applied. All samples were analyzed following this continuing calibration.

V-Blank Analysis

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. A method blank analysis must be performed after the calibration standards and once every 12-hour time period beginning with the injection of DFTPP. No contaminants should be detected in any of the associated blanks > the MDL. DoD QSM criteria specifies all concentrations should be less than one-half MRL (<MRL for common laboratory contaminants phthalate esters). Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants phthalate esters, or 5 times (5X) the maximum amount for other semivolatile target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
9/11/07	OP22198-MB	All SVOC target <½MRL	NA	NA	None
9/21/07	OP22199-MB	All PAH SIM target <½MRL	NA	NA	None
9/15/07	RB083007	All SVOC target <½MRL	NA	NA	None
9/20/07	RB083007	All PAH SIM target <½MRL	NA	NA	None

NA = Not applicable.
MRL = Method reporting limit.

VI-Surrogate Spikes
Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Surrogate spikes are added to all samples and blanks to measure their recovery in sample and blank matrices. The percent recoveries (%Rs) must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-2 and Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Criteria:
2-Fluorophenol (14-62%) – (DoD QSM = 20-110%)
Phenol – d5 (10-40%) – (DoD QSM = 10-115%)
2,4,6-Tribromophenol (33-118%) – (DoD QSM = 40-125%)
Nitrobenzene-d5 (42-108%) – (DoD QSM = 40-110%)
2-Fluorobiphenyl (40-106%) – (DoD QSM = 50-110%)
p-Terphenyl – d14 (39-121%) – (DoD QSM = 50-135%)

- The MS had a high phenol-d5 (50.0%) recovery, while the MSD had a low high 2-fluorobiphenyl (48.0%) recovery. The unspiked sample surrogate recoveries met criteria, no qualifiers were applied.

- All other field samples met surrogate recovery criteria. No qualifiers were applied.

VII-Internal Standards
Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Internal standard area counts for samples and blanks must not vary by more than a factor of two (-50% to +100%) from the associated calibration standard. The retention time of the internal standards in samples and blanks must not vary by more than ±30 seconds from the retention time of the associated calibration standard.

- All criteria were met. No qualifiers were applied.

VIII-Laboratory Control Sample
Laboratory control samples (LCS) are used to monitor laboratory accuracy by calculating the percent recoveries of the spiked compounds. All LCS percent recoveries must be within the specified control limits. DoD LCS aqueous recovery limits are specified in Table D-2 and Table D-6 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP22198-BS was used as the aqueous LCS for the SVOC analysis on 9/11/07. All compounds met recovery criteria. No qualifiers were applied. All samples were analyzed in conjunction with this LCS.

- Sample OP22199-BS was used as the aqueous LCS for the PAH-SIM analysis on 9/20/07. All compounds met recovery criteria. No qualifiers were applied. All samples were analyzed in conjunction with this LCS.

IX-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD aqueous MS/MSD recovery limits follow the LCS criteria and are specified in Table D-2 and Table D-6 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample 52160-2 was used for the aqueous MS/MSD during SVOC analysis on 9/11/07. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. All samples were analyzed in conjunction with this MS/MSD.

- Sample 48MW3 was used for the MS/MSD for the solid PAH SIM analysis on 9/21/07. All compounds met recovery criteria. No qualifiers were applied. All samples were analyzed in conjunction with this MS/MSD.

X-Field Duplicate Sample Analysis

Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field duplicate pairs in this data set included 59MW01 & TMMW01, and 48MW3 & TMMW3. All compounds detected above the MDL met RPD criteria. No data qualifiers were applied.

XI-Quantitation Verification

The accuracy of analytical results was verified through the calculation of several parameters. Percent difference (%D) between the calculated and reported values must be ≤10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J."

Sample: OP22198-BS, benzoic acid

Conc. (µg/L) = {(Ax)*(Is)*(Vt)*(DF)}/{(Ais)*(RRF)*(V_o)*(V_i)}

where:	$Conc_{sample}$	=	Sample concentration in µg/L
	A_x	=	Area of characteristic ion for compound being measured.
	I_s	=	Amount of internal standard injected (ng).
	V_t	=	Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10,000 µL.
	A_{is}	=	Area of characteristic ion for the internal standard.
	RRF_A	=	Average relative response factor for compound being measured
	V_o	=	Volume of water extracted (mL).
	V_i	=	Volume of extract injected (µL).
	DF	=	Dilution Factor

Conc. µg/L = (95631 * 40 * 1000 * 1) / (780594 * 0.323 * 1000 * 1) = 15.2 ng/mL
= 15.2 µg/L

Reported Value = 15.2 µg/L
% Difference = 0.0%
Values were within 10% difference.

Sample: OP22199-BS, bezno(a)pyrene

Conc. (µg/L) = {(Ax)*(Is)*(Vt)*(DF)}/{(Ais)*(RRF)*(V_o)*(V_i)}

where:	$Conc_{sample}$	=	Sample concentration in µg/L
	A_x	=	Area of characteristic ion for compound being measured.
	I_s	=	Amount of internal standard injected (ng).
	V_t	=	Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10,000 µL.
	A_{is}	=	Area of characteristic ion for the internal standard.
	RRF_A	=	Average relative response factor for compound being measured
	V_o	=	Volume of water extracted (mL).
	V_i	=	Volume of extract injected (µL).
	DF	=	Dilution Factor

Conc. µg/L = (68314 * 4 * 1000 * 1) / (98767 * 1.335 * 1000 * 1) = 2.1 ng/mL
= 2.1 µg/L

Reported Value = 2.1 µg/L
% Difference = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation - Volatiles
Accutest Laboratories, Inc., SDG F52170

DATE: November 5, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on August 29, 2007. The samples were analyzed for target compound list (TCL) volatile organic compounds (VOCs) using USEPA SW846 Method 5030B/8260B. A total of nine aqueous samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
59MW01	F52170-1	TMMW3	F52170-6
48MW1	F52170-2	48MW4	F52170-7
TMMW01	F52170-3	49MW1	F52170-8
48MW2	F52170-4	TB082907	F52170-9
48MW3	F52170-5		

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Instrument Performance Results
	X	Initial Calibration
	X	Continuing Calibration
	X	Blank Analysis
	X	Laboratory Control Sample
	X	Matrix Spike / Spike Duplicate Sample
	X	System Monitoring Compounds
	X	Internal Standards
	X	Field Sample Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

RFAAP VALIDATION REPORT
VOLATILES REVIEW
SDG F52170

I-Holding Times and Preservation
The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of analysis. Holding time criteria: For aqueous samples cooled @ 4°C±2°C; pH<2 HCl, the maximum holding time is 14 days (7 days if no HCl added) from sample collection to analysis. For soil samples cooled @ 4°C±2°C; the maximum holding time is 14 days from sample collection to analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 8/29/07 were sent in 20 coolers, and were received by the laboratory on 8/30/07 at temperatures ranging from 0.8°C to 3.6°C, with 9 of the 20 coolers having temperatures below 2.0°C. The low sample temperatures are not expected to have an adverse impact on the analytical results. No qualifiers were applied.

- Holding Time Review: The aqueous samples were collected for VOCs on 08/29/07 and analyzed on 9/10/07 and 9/12/07. All criteria were met. No qualifiers were applied.

II-Instrument Performance Check
The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed.

- The instrument performance check, bromofluorobenzene (BFB), met the ion abundance criteria. No qualification was applied.

III-Initial Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The RRF must be greater than 0.1 for chloromethane, 1,1-dichloroethane, and bromoform and greater than 0.3 for 1,1,2,2-tetrachloroethane and chlorobenzene. The minimum relative response factor (RRF) must be ≥0.05 for all other compounds. The DoD QSM specifies that the percent relative standard deviation (%RSD) must be ≤15% for each target compound and must be ≤30% for each calibration check compound. For compounds analyzed using linear regression or second order, correlation coefficients must be >0.995 and coefficients of determination >0.99. All detects are qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- During the 9/7/07 initial calibration performed on instrument MSVOA4, target compounds acetone (15.12%), chloroethane (15.55%), 2-hexanone (20.41%), 4-methyl-2-pentanone (24.74%), methylene chloride (33.22%), and styrene (17.15%) were outside %RSD criteria. All other target compounds met %RSD criteria, and all compounds met RRF criteria. The compounds with high %RSD were quantified using second order regression, and had correlation coefficients >0.995; therefore, no qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Continuing calibration establishes the 12-hour relative response factors on which the quantitations are based and checks satisfactory performance of the instrument on a day-to-day basis. The RRF must be greater than 0.1 for chloromethane, 1,1-dichloroethane, and bromoform and greater than 0.3 for 1,1,2,2-tetrachloroethane and chlorobenzene. The minimum relative response factor (RRF) must be ≥0.05 for all other compounds. The DoD QSM specifies that the percent difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within 20% for all target compounds. All detects are qualified as estimated "J" for where there were exceeding %Ds, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- During the initial calibration verification performed on 9/7/07 @1307 on instrument MSVOA4, acetone (31.6%) had a %drift outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). No samples were analyzed following this initial calibration verification, therefore no qualifiers were applied.

- During the continuing calibration performed on 9/10/07 @1158 on instrument MSVOA4, acetone (28.8%) and methylene chloride (33.7%) had %drift outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). No acetone or methylene chloride was detected in any of the associated samples, so no data qualification was required. Samples 59MW01, 48MW1, and TMMW01 were analyzed following this continuing calibration.

- During the continuing calibration performed on 9/12/07 @1010 on instrument MSVOA4, all target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). No data qualification was required. Samples 48MW2, 48MW3, TMMW3, 48MW4, 49MW01, and TB082907 were analyzed following this continuing calibration.

V-Blank Analysis

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. A method blank analysis must be performed after the calibration standards and once every 12-hour time period beginning with the injection of BFB. No contaminants should be detected in any of the associated blanks > the MDL. The DoD QSM criteria specifies all concentrations should be less than one-half MRL (<MRL for common laboratory contaminants methylene chloride, acetone, and 2-butanone). Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants methylene chloride, acetone, and 2-butanone (MEK), or 5 times (5X) the maximum amount for other volatile target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
9/10/07	VB2032-MB	All target <½MRL	NA	NA	None
9/12/07	VB2034-MB	Chloroform	0.62 J	3.1	None
9/12/07	VB2034-MB	Methylene chloride	4.7 J	47	None
9/12/07	TB083007	All target <½MRL	NA	NA	None
9/13/07	RB083007	All target <½MRL	NA	NA	None

NA = Not Applicable
MRL = Method Reporting Limit

VI-Laboratory Control Sample
Data for laboratory control samples (LCS) are evaluated to determine long-term accuracy of the analytical method on various matrices. Percent recoveries (%Rs) should be within the specified control limits. The DoD aqueous LCS recovery limits are specified in Table D-4 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample VB2032-BS was used as the aqueous LCS for the VOC analysis on 9/10/07. All target compound recoveries were within criteria. No data qualifiers were applied. Samples 59MW01, 48MW1, and TMMW01 were analyzed in conjunction with this LCS.

- Sample VB2034-BS was used as the aqueous LCS for the VOC analysis on 9/12/07. Methyl chloride (135%) was above the DoD QSM criteria. No methyl chloride was detected in any samples, therefore no data qualifiers were applied. All other target compound recoveries were within criteria. Samples 48MW2, 48MW3, TMMW3, 48MW4, 49MW01, and TB082907 were analyzed in conjunction with this LCS.

VII-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. The DoD MS/MSD aqueous recovery limits follow the LCS criteria and are specified in Table D-4 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample 48MW3 was used for the aqueous MS/MSD analysis on 9/12/07. Methyl chloride (147%, 143%) was above the DoD QSM criteria. No methyl chloride was detected in any samples, therefore no data qualifiers were applied. All other target compound recoveries were within criteria. All samples were analyzed in conjunction with this MS/MSD.

VIII-System Monitoring Compounds (Surrogates)
Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Recoveries for system monitoring compounds in volatile samples and blanks must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Criteria: Dibromofluoromethane (87-116%) (DoD QSM = 85-115%)
1,2-Dichloroethane-d4 (76-127%) (DoD QSM = 70-120%)
Toluene-d8 (86-112%) (DoD QSM = 85-120%)
4-Bromofluorobenzene (84-120%) (DoD QSM = 75-120%)

- All samples met criteria. No qualifiers were applied.

IX-Internal Standards (IS)
Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Specific criteria include: area counts (-50% to +100%) of the associated calibration standard, and retention time (± 30 seconds) from that of the associated calibration standard.

- All samples met criteria. No qualifiers were applied.

X-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- Field duplicate pairs in this data set included 59MW01 & TMMW01, and 48MW3 & TMMW3. All compounds detected above the MDL met RPD criteria. No data qualifiers were applied.

XI-Quantitation Verification
The accuracy of analytical results is verified through the calculation of several parameters. The percent difference (%D) between the calculated and the reported values should be within 10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J."

Sample: 48MW3, carbon tetrachloride

Conc. (μg/L) = (Ax * Is * DF)/(Ais * RRF * Vo)

where: Ax is the compound area
Is is the amount of internal standard added (ng)
DF is the dilution factor
Ais is the internal standard area
RRF is the relative response factor
Vo is the volume of water purged (ml)

Conc. μg/L = (768096 * 250 * 1) / (1677869 * 0.379 * 5) = 60.4 μg/L

Reported Conc. = 60.3 μg/L
%D = 0.17%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Dioxin Furans
SGS Paradigm Analytical Laboratories, Inc. Project G383-602
(Accutest SDG F52208)

DATE: November 2, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on August 30, 2007. The samples were analyzed for Dioxin and Furan compounds using USEPA SW-846 Method 8290 High Resolution Gas Chromatography/High Resolution Mass Spectroscopy (HRGC/HRMS). A total of six aqueous samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
RB083007	F52208-1	50MW02	F52208-4
50MW01	F52208-2	48MW05	F52208-5
48MW07	F52208-3	48MW06	F52208-6

Data were reviewed and validated using a combination of project QAPP, *DOD Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *USEPA Region III Dioxin/Furan Data Validation Guidance* (March, 1999). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Blank Analysis
	X	Instrument Performance Check
	X	Initial Calibration
	X	Continuing Calibration
	X	Internal Standards (IS) Recovery Standard Solutions
	X	Cleanup Standards
	X	Laboratory Control Standard or Ongoing Precision Result (OPR)
	X	Matrix Spike and Spike Duplicate
	X	Field Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Richard McCracken, Chemist

Date

RFAAP VALIDATION REPORT
DIOXIN FURAN REVIEW
SDG G383-602
(Accutest SDG F52208)

I-Holding Times and Preservation

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. For aqueous samples, dioxin and furans are shipped @4°C ± 2°C, with a maximum holding time of 30 days from sample collection to preparative extraction and 45 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 8/30/07 were sent in 15 coolers, and were received by the laboratory on 8/31/07 at temperatures ranging from 0.6°C to 2.2°C, with 12 of the 15 coolers having temperatures below 2.0°C. The low sample temperatures are not expected to have an adverse impact on the analytical results. Accutest shipped the dioxin aliquot to SGS Paradigm Analytical Laboratories on 9/4/07, they were received by DataChem on 9/5/07 at 4.3°C. No qualifiers were applied.

- Holding Time Review: The samples were collected on 8/30/07, extracted on 9/6/07, and analyzed on 9/8/07 & 9/9/07. All criteria were met. No qualifiers were applied.

II-Blank Analysis

The purpose of laboratory (or field) blank analyses is to determine the existence and magnitude of contamination problems resulting from field and laboratory activities. No contamination should be found in any of the blanks >EDL (estimated detection limit). The DoD QSM criteria specifies all concentrations should be less than ½ MRL (<MRL for common laboratory contaminants OCDD and OCDF) and <2EDL for the calibration blanks. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants OCDD or OCDF, or 5 times (5X) the maximum amount for other target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. ng/L	Action Level ng/L	B qualified samples
9/8/07	LMB14381	All congeners <EDL	NA	NA	None
9/09/07	RB083007	All congeners <EDL	NA	NA	None

J = Estimated value <MRL and >EDL.

III-Instrument Performance Check

Instrument must be tuned with perfluorokerosene (PFK) to achieve a static resolving power of at least 10,000 (10% valley) and lock-mass ion between lowest and highest masses for each descriptor and level of reference compound ≤10%. Documentation of the mass spectrometer resolving power is accomplished by recording the peak profile of the high-mass reference signal (typically m/z 330.9792) obtained during a peak examination by using the low-mass PFK ion at m/z 292.9825 or lower in mass as reference. At the beginning of the each 12-hour period, the chromatographic resolution is verified in the same fashion as in the initial calibration through the analysis of HRCC solution on the DB-5 (or equivalent) column or through the analysis of the column performance solution on the SP-2331 or SP-225 (or equivalent) column. A 25% valley must be achieved between the close eluters.

- All PFK forms were verified and found to be in compliance with method specification. No qualifiers were applied.

IV-Initial Calibration
Once the window defining mix has been analyzed and the descriptor switching times have been verified, the five point calibration solutions can be analyzed prior to sample analysis. Per method and DoD QSM, the initial calibration criteria are as follows:

- The percent relative standard deviations for the mean response factors RRF(n) from the 17 unlabeled standards must not exceed ±20%, and those for the labeled reference compounds must not exceed ±30%;
- The signal to noise ratio ≥10% for all target ions;
- Ion abundance ratios must be within the specified control limits in Table 8 (SW846 Method 8290).

- During initial calibration performed on 07/10/07 using instrument HRMS1, all compounds met criteria. No qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

V-Continuing Calibration
The continuing calibration consists of two parts: evaluation of the mass resolution and retention time check. Per method and DoD QSM, the following stipulates the continuing calibration criteria.

- The signal signal-to-noise ratio (S/N) must be at least 10:1 for each selected ion current profile (SICP) and for each GC signal representing the elution of a target analyte or labeled standard for each analyte.
- The relative response factor of each analyte for the unlabeled standard must be within ±20% of the average RF obtained from the initial calibration, and the RRF of each labeled standard must be within ±30% of the average RRF established during initial calibration. This is expressed in term of percent difference %D.
- Ion abundance ratios must be within the specified control limits in Table 8 (SW846 Method 8290).

- During the continuing calibration performed on 9/8/07 @1115 on instrument HRMS1, all criteria were met. No qualifiers were applied. Samples 48MW07, 50MW02, and 48MW05 were analyzed following this continuing calibration.

- During the continuing calibration performed on 9/8/07 @2236 on instrument HRMS1, all criteria were met. No qualifiers were applied. Samples 48MW07, 50MW02, and 48MW05 were analyzed before this continuing calibration, while samples RB083007, 50MW01, and 48MW06 were analyzed following this continuing calibration.

- During the continuing calibration performed on 9/9/07 @0958 on instrument HRMS1, all criteria were met. No qualifiers were applied. Samples RB083007, 50MW01, and 48MW06 were analyzed before this continuing calibration.

VI-Internal Standards (IS) Recovery Standard Solutions
Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Specific criteria include: Recoveries of the isotopically-labeled recovery standards to fall within the 40 to 135 percent range for the tetra- through octachlorinated congeners, or as stated in the data package (DoD QSM limits 40-135%).

- All criteria were met. No qualifiers were applied.

VII-Cleanup Standards
Cleanup standards are added to every sample, blank, quality control sample, and calibration solution. This compound is added to the samples after extraction but prior to cleanup and is used to verify the percent recovery obtained using the isotope dilution technique. The control limits are 40 to 135 percent (DoD QSM limits 40-135%).

- All criteria were met. No qualifiers were applied.

VIII-Laboratory Control Standard (LCS) or Ongoing Precision Result (OPR)
LCSs are used to monitor laboratory accuracy and precision by calculating the percent recoveries of the spiked compounds. Per DOD QSM and method criteria, acceptable performance is determined by:

1. Recoveries of the isotopically-labeled extraction standards to fall within 40-135% control limits for the tetra- through octachlorinated congeners, or as stated in the data package;

2. Recoveries (accuracy) of the unlabeled compounds should be within ±35% when spiked at the method quantitation limit and within ±30% when spiked above 20 times the method quantitation limit, or as stated in the data package;

3. When duplicate OPR are required, the relative percent difference (RPD) of the unlabeled analytes concentrations should be within 30% when spiked at the method quantitation limit and within ±20% when spiked above 20 times the method quantitation limit.

- Sample OPR14457 was used as LCS and LCSD on 9/8/07 analytical run. All criteria were met. No qualifiers were applied. All samples were analyzed in conjunction with this LCS.

IX-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. Per DoD QSM, MS/MSD recoveries must be within in-house laboratory limits (75-125%) and RPD ≤20%.

- No project specific MS/MSD was performed; therefore, it was not evaluated.

X-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No field duplicates were included in this data set.

XI-Quantitation Verification

The accuracy of analytical results was verified through the calculation of at least one the several parameters such as the %D, %RSD, % recovery, and/or compound concentration. Values were found to be within 10%. Any value reported by the laboratory as estimated "A" based on an analyte to internal standard ratio below the calibration curve was qualified as estimated "J". The signal signal-to-noise ratio (S/N) must be greater than 2.5 for each selected ion current profile (SICP) and for each GC signal representing the elution of a target analyte or labeled standard. Any detected value with ether interference (I-lab flag) was qualified as estimated "J". For where the ion ratio failed the 25% criteria (*-lab flag), the estimated maximum possible concentration (EMPC) was reported and flagged estimated "J". For where presence of quantitation interference (Q-lab flag), the date was flagged estimated "J" for detects and "UJ" for non-detects.

- The OCDD result in 50MW01 (F52208-2) has been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit.

- The OCDD result in 48MW07 (F52208-3) has been qualified "J" as estimated since the amount detected was less than the Lower Method Calibration Limit.

- The 1,2,3,7,8,9-HxCDD, 1,2,3,4,6,7,8-HpCDD, OCDD, 2,3,7,8-TCDF, 1,2,3,4,7,8-HxCDF, 1,2,3,4,6,7,8-HpCDF, and OCDF results in 50MW02 (F52208-4) have been qualified "J" as estimated since the amount of each compound detected was less than the Lower Method Calibration Limit. Note that the ion abundance ratio for 1,2,3,7,8,9-HxCDD did not meet criteria and has been reported as an Estimated Maximum Possible Concentration (EPMC). Since the result has already been qualified "J", no further qualification is required.

- The OCDD and 1,2,3,4,6,7,8-HpCDF results in 48MW06 (F52208-6) have been qualified "J" as estimated since the amount of each compound detected was less than the Lower Method Calibration Limit.

Sample: 50MW01 (F52208-2), OCDD

A(x) = sum of the integrated ion abundances of the quantitation ions for the unlabeled ions;
A(is) = sum of the integrated ion abundances of the quantitation ions for the labeled ions;
Q(is) = quantity, in ng/ul, of the internal standard added to the sample before extraction;
V = volume in mL of the aqueous sample; and
Avg. RRF(n) = calculated mean relative response factor for the unlabeled analyte.

$$\text{Conc. (ng/L)} = \frac{(A(x))\ *Q(is)*1000}{A(is)\ *\ V\ *\ \text{Avg. RRF}} = \frac{(305000)*4.0*1000}{(66900000)\ *\ 919\ *\ 1.0783} = 0.0184 \text{ ng/L}$$

Reported Value = 0.0184 ng/L
% Difference = 0.0%
Values were within 10% difference

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ EDL and <MRL or <3*EDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥EDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ EDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Explosives, PETN, & Nitroglycerin
Accutest Laboratories, Inc., SDG F52208

DATE: November 1, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on August 30, 2007. The samples were analyzed for explosives, nitroglycerin, and PETN using USEPA SW-846 3535A/8330A. A total of six aqueous samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
RB083007	F52208-1	50MW02	F52208-4
50MW01	F52208-2	48MW05	F52208-5
48MW07	F52208-3	48MW06	F52208-6

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Blank Analysis
	X	Initial Calibration
	X	Continuing Calibration
	X	System Monitoring Compounds
	X	Laboratory Control Sample
	X	Matrix Spike/Spike Duplicate
	X	Field Duplicate
	X	Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable.

Richard McCracken, Chemist

Date

RFAAP VALIDATION REPORT
EXPLOSIVES REVIEW
SDG F52208

I-Holding Times and Preservation

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. For aqueous samples, explosive compounds are shipped @4°C ± 2°C, with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 8/30/07 were sent in 15 coolers, and were received by the laboratory on 8/31/07 at temperatures ranging from 0.6°C to 2.2°C, with 12 of the 15 coolers having temperatures below 2.0°C. The low sample temperatures are not expected to have an adverse impact on the analytical results. No qualifiers were applied.

- Holding Time Review: The samples were collected on 8/30/07, extracted on 9/5/07, analyzed for PETN and nitroglycerine on 9/7/07, and analyzed for all other explosives on 9/12/07. All criteria were met. No qualifiers were applied.

II-Blank Analysis

The purpose of laboratory or field blank analyses is to determine the existence and magnitude of contamination problems resulting from laboratory or field activities. One method blank per analytical batch must be run on each instrument used to analyze samples. No contaminants should be present in the blanks. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤5 times (5x) the maximum amount for explosive target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
9/11/07	OP22200-MB	All target explosives <½MRL	NA	NA	None
9/12/07	OP22200-MB	All target explosives <½MRL	NA	NA	None
9/7/07	OP22200-MB	PETN & NG <½MRL	NA	NA	None
9/11/07	RB083007	All target explosives <½MRL	NA	NA	None
9/07/07	RB083007	PETN & NG <½MRL	NA	NA	None

MRL = Method Reporting Limit
NA = Not Applicable

III-Initial Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. The initial 5-point calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run. The DoD QSM specifies that the correlation coefficient (r^2) must be ≥0.990 and/or the percent relative standard deviation (%RSD) must be ≤20%. All detects were qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects were qualified as estimated "UJ" for where there were grossly exceeding recoveries. Grossly exceeding is defined as twice the established criteria limits.

- During the explosives initial calibration performed on 9/11/07 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

- During the PETN and nitroglycerine initial calibration performed on 03/15/07 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

IV-Continuing Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. Continuing calibration standards are analyzed after every 10 injections, and at the end of the analysis sequence. The DoD QSM specifies that the percent difference (%D) from initial calibration should be no greater than ±20%. All detects were qualified as estimated "J" for where there were exceeding %Ds, and all non-detects were qualified as estimated "UJ" for where there were grossly exceeding recoveries. Grossly exceeding is defined as twice the established criteria limits.

- During the explosives initial calibration verification performed on 9/11/07 @2153 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples RB083007, 50MW01, 48MW07, 50MW02, and 48MW05 were analyzed after this initial calibration verification.

- During the explosives continuing calibration verification performed on 9/12/07 @0256 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples RB083007, 50MW01, 48MW07, 50MW02, and 48MW05 were analyzed prior to this continuing calibration, while 48MW06 was analyzed after this continuing calibration.

- During the explosives continuing calibration verification performed on 9/12/07 @0446 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Sample 48MW06 was analyzed prior to this continuing calibration.

- During the PETN and nitroglycerin initial calibration verification performed on 3/15/07 @1235 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. No samples were analyzed in conjunction with this initial calibration verification.

- During the PETN and nitroglycerin continuing calibration performed on 9/7/07 @1417 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples RB083007, 50MW01, 48MW07, 50MW02, and 48MW05 were analyzed after this continuing calibration.

- During the PETN and nitroglycerin continuing calibration performed on 9/7/07 @1600 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Samples RB083007, 50MW01, 48MW07, 50MW02, and 48MW05 were analyzed prior to this continuing calibration, while 48MW06 was analyzed after this continuing calibration.

- During the PETN and nitroglycerin continuing calibration performed on 9/7/07 @1638 on instrument G1315B, all criteria were met for target compounds. No qualifiers were applied. Sample 48MW06 was analyzed prior to this continuing calibration.

V-System Monitoring Compound (Surrogates)
Laboratory performance on individual samples is established by means of spiking activities. The percent recovery (%R) for all samples and blanks must be within the laboratory control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Criteria: 3,4-dinitrotoluene (70-136%)

- All criteria were met for explosives, PETN, and nitroglycerin. No qualifiers were applied.

VI-Laboratory Control Sample
Laboratory control samples (LCS) are used to monitor long-term accuracy of the analytical method. The analysis is performed at a frequency of 1 per analytical batch. The percent recoveries (%Rs) must be within the laboratory control limits. DoD QSM aqueous LCS recovery limits are specified in Table D-12 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP22200-BS was used as the LCS for PETN, nitroglycerin, and explosives analysis on 9/11/07. HMX (116%) had a high recovery, but no HMX was detected in any samples so no qualifiers were applied. All other compounds met recovery criteria. All samples were analyzed in conjunction with this LCS.

VII-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the laboratory control limits. DoD QSM aqueous MS/MSD recovery limits follow the LCS criteria and are specified in Table D-12 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample 48MW07 was used as the MS/MSD for the explosive analysis. All compounds met criteria. No qualifiers were applied. All samples were analyzed in conjunction with this MS/MSD.

VIII-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No field duplicates were included in this data set.

IX-Quantitation Verification
The accuracy of analytical results was verified through the calculation of several parameters. The calculation was based calibration factors. The absolute percent difference (%D) between the calculated and the reported value must be within 10% difference. All values >MDL and <MRL or <3*MDL (whichever was greater) were qualified as estimated "J".

- The %D between the primary and secondary columns was within criteria for all detected explosives, PETN, and nitroglycerin.

Sample: RB083007MS,HMX

Conc. µg/L = (Ax * Vt * DF) / (CF * Vs)

where: Conc. = Sample concentration in µg/L
Ax = Area of characteristic ion for compound being measured
Vt = Volume of total extract (mL)
DF = Dilution factor
CF = Average relative calibration factor for compound being measured (from ICAL)
Vs = Volume of sample extracted (mL)

Conc. µg/L = (1474974 * 10 * 1) / (2921 * 500) = 10.1 µg/L

Reported Value = 10.1 µg/L
% Difference = 0.0%
Values were within 10% difference

Sample: RB083007MS, nitroglycerin

Conc. µg/L = (Ax * Vt * DF) / (CF * Vs)

where: Conc. = Sample concentration in µg/L
Ax = Area of characteristic ion for compound being measured.
Vt = Volume of total extract (mL).
DF = Dilution factor
CF = Average relative calibration factor for compound being measured (from ICAL)
Vs = Volume of sample extracted (mL).

Conc. µg/L = (3118401 * 10 * 1) / (1228 * 500) = 50.8 µg/L

Reported Value = 50.8 µg/L
% Difference = 0.0%
Values were within 10% difference

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I RFAAP Project Manager

FROM: Richard McCracken, Shaw E&I RFAAP Project Chemist

SUBJECT: Radford Army Ammunition Plant (RFAAP) Data Validation – Herbicides
Accutest Laboratories, Inc., SDG F52208

DATE: October 31, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on August 30, 2007. Aqueous samples were analyzed for chlorinated herbicides using USEPA SW846 Method 3510C/8151A. A total of six aqueous samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
RB083007	F52208-1	50MW02	F52208-4
50MW01	F52208-2	48MW05	F52208-5
48MW07	F52208-3	48MW06	F52208-6

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times
	X	Initial Calibration
	X	Continuing Calibration
	X	Blank Analysis
	X	System Monitoring Compounds
X		Laboratory Control Sample
	X	Matrix Spike/Spike Duplicate
	X	Field Duplicate
	X	Quantitation Verification

The dalapon results have been rejected in all samples due to a 0% recovery in the LCS. The quality of all other data collected in support of this sampling activity is considered acceptable with noted qualifications.

Richard McCracken, Chemist

Date

RFAAP VALIDATION REPORT
CHLORINATED HERBICIDES REVIEW
SDG F52208

I-Holding Times

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. For aqueous samples, chlorinated herbicides compounds are shipped @4°C ± 2°C, with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 8/30/07 were sent in 15 coolers, and were received by the laboratory on 8/31/07 at temperatures ranging from 0.6°C to 2.2°C, with 12 of the 15 coolers having temperatures below 2.0°C. The low sample temperatures are not expected to have an adverse impact on the analytical results. No qualifiers were applied.

- Holding Time Review: The samples were collected on 8/30/07, extracted on 9/6/07, and analyzed on 9/10/07. All criteria were met. No qualifiers were applied.

II-Initial Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The DoD QSM specifies that the percent relative standard deviation (%RSD) for a 5-point standard calibration should be ≤20% for each target compound.

- No initial calibration data was provided for MCPP or MCPA. During discussions with the laboratory, they indicated that they perform a one-point calibration each day that analysis for MCPP or MCPA is conducted. A five-point initial calibration was not performed, therefore all data for these two compounds has been qualified "J/UJ".

- During the initial calibration performed on 9/9/07 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

III-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Continuing calibration establishes the response factors on which the quantitations are based and checks satisfactory performance of the instrument on a day-to-day basis. The DoD QSM specifies that the percent difference (%D) between the initial calibration CF and the continuing calibration CF must be ≤20%.

- A one-point daily calibration was provided for MCPP and MCPA, indicating that the lab is able to detect and quantitate both compounds. %D data was not supplied since a five-point initial calibration was not performed. All MCPP and MCPA data has already been qualified (see initial calibration), no additional qualification is required.

- During continuing calibration performed on 9/10/07 @0750 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. All samples were analyzed following this continuing calibration.

- During continuing calibration performed on 9/10/07 @1424 on instrument GC-GG, all target compounds (except MCPP and MCPA – see above) met criteria for signal #1 and signal #2. No qualifiers were applied. All samples were analyzed prior to this continuing calibration.

IV-Blank Analysis

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field or laboratory activities. No contaminants should be detected in any of the associated blanks. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are qualified "B" if the concentration of the analyte is ≤ five times (5x) the absolute maximum blank concentration. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
9/10/07	OP8030-MB	All target compounds <½MRL	NA	NA	None
9/10/07	RB083007	All target compounds <½MRL	NA	NA	None

V-System Monitoring Compounds (Surrogates)

Laboratory performance on individual samples is established by means of spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. Spike recoveries must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Control Limit: 2,4-DCAA (34-179%)

- All samples met recovery criteria.

VI-Laboratory Control Samples

Data for laboratory control samples (LCS) are generated to determine long-term precision and accuracy of the analytical method. Percent recoveries must be within the specified control limits. DoD QSM aqueous LCS recovery limits are specified in Table D-8 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP8030-BS was used as the LCS during the 9/10/07 run. 2,4,5-TP (Silvex) (118%) had a high recovery, but no 2,4,5-TP was detected in any samples so no qualifiers were applied. Dalapon met recovery criteria in the LCS, but had a 0% recovery in the LCS duplicate. No dalapon was detected in any samples, all dalapon results have been rejected "R". Five compounds (besides dalapon) had RPDs above the laboratory criteria, but all recoveries for these compounds met criteria, no action is taken on RPD alone. All other herbicides were within criteria. All samples were analyzed in conjunction with this LCS.

VII-Matrix Spike/Matrix Spike Duplicate

Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD QSM aqueous MS/MSD recovery limits follow the LCS criteria and are specified in Table D-8 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- MS/MSD analysis was not performed due to insufficient sample volume. No data qualifiers were applied.

VIII-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were qualified because of blank contamination (B-qualified) or were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No field duplicates were included in this data set.

IX-Quantitation Verification
The accuracy of analytical results is verified through the calculation of several parameters. Percent difference (%D) between the calculated value and the reported value must be within 10%. All positive values must have less than or equal to 40% %D between the primary and secondary columns. Any sample value >MDL and <MRL is qualified as estimated, "J." All criteria were met. No qualifiers were applied.

- The %D between the primary and secondary columns was within criteria for all detected chlorinated herbicides.

Sample: OP8030-BS duplicate, 2,4,5-TP (Silvex)

Conc. µg/L = (A * DF * Vt) / (CF * Vo)

where: A = Area response of the sample
CF = Calibration Factor from initial calibration (area/(ug/L))
Vt = volume of final extract (mL)
DF = dilution factor
Vo = volume of the sample extracted (mL)

Conc. µg/L = (3898147 * 1 * 10 mL) / (83090 * 1000 mL)
= 0.47 ng/mL = 0.47 µg/L

Reported Conc. = 0.47 µg/L
%D = 0.0%
Values were within 10% difference

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

A (Dioxins) = MDL is based upon the signal-to-noise measurement.

B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics and Dioxins) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

D (Organics) = Indicates sample was analyzed at a dilution.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

E (Dioxins) = Reported value is estimated because of the presence of ether interferences.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/F ions is outside accepted ranges. The detected PCDD/F is reported as an estimated maximum possible concentration (EMPC).

I (Dioxins) = Reported value is estimated because of the incorrect isotope rations were obtained.

J (All) = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, (2) estimating a concentration <MRL and ≥ MDL, or estimating a concentration below the calibration range.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

U (All) = ND = BQL = Not detected. The associated number indicates the compound reporting limit for the sample.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – TAL Metals
Accutest Laboratories, Inc., SDG F52208

DATE: October 31, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on August 30, 2007. The samples were analyzed for target analyte list (TAL) metals using USEPA SW-846 3010A/6010B for ICP metals and SW-846 7470A for mercury. A total of six aqueous samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
RB083007	F52208-1	50MW02	F52208-4
50MW01	F52208-2	48MW05	F52208-5
48MW07	F52208-3	48MW06	F52208-6

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Inorganic Data Review* (April, 1993). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times
X		Initial and Continuing Calibration
X		Blank Analysis
	X	ICP Interference Check Sample (ICS)
	X	Laboratory Control Sample (LCS)
	X	Laboratory Sample Duplicate
	X	Matrix Spike and Spike Duplicate
	X	ICP Serial Dilution
	X	Field Sample Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Richard M. Cracken

RFAAP VALIDATION REPORT
METALS REVIEW
SDG F52208

I-Holding Times

The primary objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample analysis. Holding time criteria: For aqueous matrices, the samples are shipped cool @4°C±2°C and preserved to pH<2 with HNO_3 with a maximum holding time is 180 days for ICP metals and 28 days for mercury.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 8/30/07 were sent in 15 coolers, and were received by the laboratory on 8/31/07 at temperatures ranging from 0.6°C to 2.2°C, with 12 of the 15 coolers having temperatures below 2.0°C. The low sample temperatures are not expected to have an adverse impact on the analytical results. No qualifiers were applied.

- Holding Time Review: The samples were collected 8/30/07 for metals analysis, digested for mercury on 9/5/07, analyzed for mercury on 9/5/07, digested for ICP metals on 9/14/07, and analyzed for ICP metals on 9/17/07 & 9/18/07. All criteria were met. No qualifiers were applied.

II-Initial and Continuing Calibration

Requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable quantitative data. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of the analysis run, and continuing calibration verification documents that the initial calibration is still valid.

ICP:
1- blank (DoD QSM <½ MRL)
3 – standards (r≥0.995)
ICV/CCV (90-110%) (DoD QSM 90-110%)
MRL (70-130%) (DoD QSM 80-120%)
High Std. (95-105%)

Hg:
1 – blank (DoD QSM <½ MRL)
5 – standards (r≥0.995)
ICV/CCV (80-120%)(DoD QSM ICV 90-110% & CCV 80-120%)
MRL (80-120%) (DoD QSM 80-120%)
High Std. (95-105%)

- The samples were analyzed for ICP metals on 9/17/07 & 9/18/07. Mercury analysis was performed on 9/5/07, with a correlation coefficient of 0.9999. Iron (94%) had a low recovery during the High Standard analysis, and all iron results have been qualified "L". All ICVs and CCVs, and all other High Standards were met recovery criteria. **Table 2** summarizes the MRL standard analysis. Samples with concentrations detected less than two times the MRL with out of criteria MRL recovery were qualified.

Table 2 MRL Analysis Summary

Analysis Date	Analysis	MRL (µg/L)	MRL %Recovery	Qualified samples @ <2xMRL	Validation Qualifiers
9/5/07	Hg	0.2	Met criteria	None	None
9/17/07	ICP-Be	10	122.0%	50MW01, 48MW05, 48MW06	K
9/17/07	ICP-Pb	10	136.0%	48MW07, 48MW06	K
9/17/07	ICP-Se	20	130.0%	48MW06	K
9/17/07	ICP-Tl	20	76.0%	All	L/UL

III-Blanks

Blanks (preparation and calibration blanks) are assessed to determine the existence and magnitude of contamination problems. No contaminants should be detected (i.e. <MDL) in any of the associated blanks. DoD QSM limits are <½MRL for the method blank and <2*MDL for the calibration blanks. Samples are qualified "B" when they are less than 5x the absolute value of the maximum blank concentration. **Table 3** summarizes the blank contamination analysis.

Table 3 Blank Contamination Analysis Summary

Analysis Date	Analysis	QC Blank ID	Max Conc. µg/L	Action Level µg/L	B qualified samples
9/17/07	Antimony	ICB/CCBs	7.7 J	38.5	48MW05, 48MW06
9/17/07	Copper	ICB/CCBs	5.4 J	27.0	50MW01, 48MW07, 50MW02,
9/17/07	Potassium	ICB/CCBs	1710 J	8550	48MW07, 50MW02

J = Estimated value <MRL and >MDL.

IV-ICP Interference Check Sample (ICS)

The ICP interference check sample (ICS) verifies interelement and background correction factors. ICP Interference Check is performed at the beginning and end of each sample analysis run. Control limits are 80-120% (DoD QSM limits 80-120%).

- All criteria were met. No qualifiers were applied.

V-Laboratory Control Samples (LCS)

The laboratory control sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. All aqueous LCS results must fall within the control limits. The DoD QSM aqueous LCS recovery limits are specified in Table D-18 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample MP12936-BS was used as the LCS during ICP metals analysis. All criteria were met. No qualifiers were applied. All samples were analyzed in conjunction with this LCS.

- Sample MP12873-BS was used as the LCS during mercury analysis. All criteria were met. No qualifiers were applied. All samples were analyzed in conjunction with this LCS.

VI-Laboratory Duplicate Sample Analysis

Duplicate sample determinations are used to demonstrate acceptable method precision by the laboratory at the time of analysis. Duplicate analyses are also performed to generate data in order to determine the long-term precision of the analytical method on various matrices. RPDs must be within established control limits. DoD QSM limits for metals are 20% RPD for ICP metals and mercury.

- Sample 48MW3 (F52170-5) was analyzed in duplicate during ICP metals analysis. All metals met RPD criteria. No data qualifiers were applied.

- Sample 48MW3 (F52170-5) was used analyzed in duplicate during mercury analysis, and met RPD criteria. No qualifiers were applied.

VII-Matrix Spike/Spike Duplicate
MS/MSD are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. Specific criteria include the analyses of matrix spike and matrix spike duplicate samples at a frequency of one MS and MSD per 20 samples of similar matrix. MS and MSD recoveries and relative percent differences between MS and MSD recoveries should be within the specified limits. DoD QSM aqueous MS/MSD recovery limits follow the LCS criteria and are specified in Table D-18 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used. Post digestion spikes limits are 75-125% for ICP metals and mercury.

- Sample 48MW3 (F52170-5) was used as the MS/MSD during ICP metals analysis. All metals met recovery and RPD criteria. No data qualifiers were applied.

- Sample 48MW3 (F52170-5) was used as the MS/MSD during mercury analysis, and met recovery & RPD criteria. No data qualifiers were applied.

VIII-ICP Serial Dilution
An ICP serial dilution is performed to determine whether significant physical or chemical interferences exist due to sample matrix at high concentrations. An analysis of a 5-fold dilution should agree within 10% difference of the original result when the concentration in sample is a factor of 50 above MDL.

- Sample 48MW3 (F52170-5) was used as the serial dilution during ICP metals analysis. All metals met criteria. No data qualifiers were applied.

IX-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 35% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No field duplicates were included in this data set.

X-Quantitation Verification
The accuracy of analytical results is verified through the calculation of several parameters. The percent difference (%D) between the calculated and the reported values should be within 10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J." The following calculations were performed for verification.

ICP Sample: 50MW01, Manganese

Conc. (μg/L) = (conc. μg/L) *(Final Volume mL) * (DF) / (Volume Sample mL)

Conc. (μg/L) = (1226 μg/L)*(50 mL)*(1) / (50 mL) = 1230 μg/L

Reported concentration = 1230 μg/L
%D = 0.0%
Values were within 10% difference.

CVAA Sample: 50MW01, Mercury

Conc. (μg/L) = (conc. μg/L) *(Final Volume mL) * (DF) / (Volume Sample mL)

Conc. (μg/L) = (0.129 μg/L)*(50 mL)*(1) / (50 mL) = 0.13 μg/L

Reported concentration = 0.13 μg/L
%D = 0.0%.
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

D = Indicates sample was analyzed at a dilution.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

N (Metals) = Laboratory spike sample recovery not within control limits.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Perchlorate
Datachem Laboratories, Inc. SDG 07E-0792-01
(Accutest Laboratories, Inc., SDG F52208)

DATE: November 1, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP August 30, 2007. The aqueous samples were analyzed for perchlorate analysis using liquid chromatography mass spectroscopy (LC/MS) SW-846 method LC-MS-CLO4/6850 in selective ion monitoring (SIM) mode. A total of six aqueous samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
RB083007	F52208-1	50MW02	F52208-4
50MW01	F52208-2	48MW05	F52208-5
48MW07	F52208-3	48MW06	F52208-6

Data were reviewed and validated using a combination of project QAPP, *DOD Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006), *DoD Perchlorate Handbook August, Rev1, Change 1, 2007* (DoD, 2007), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Inorganic Data Review* (April, 1993). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Instrument Performance Check
X		Initial and Continuing Calibration
	X	Blank Analysis
X		Internal Standards
	X	Laboratory Control Sample (LCS)
	X	Matrix Spike (MS) and Spike Duplicate (MSD)
	X	Field Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Richard McCracken, Chemist

Date

RFAAP VALIDATION REPORT
PERCHLORATE REVIEW
SDG 07E-0792-01 (F52208)

I-Holding Times and Preservation

The primary objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample analysis. For perchlorate analysis, aqueous samples are shipped and stored at @4°C±2°C with a maximum holding time of 28 days from collection (DoD Perchlorate Handbook criteria).

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 8/30/07 were sent in 15 coolers, and were received by the laboratory on 8/31/07 at temperatures ranging from 0.6°C to 2.2°C, with 12 of the 15 coolers having temperatures below 2.0°C. The low sample temperatures are not expected to have an adverse impact on the analytical results. Accutest shipped the perchlorate aliquot to DataChem Laboratories on 9/4/07, they were received by DataChem on 9/5/07 at 4°C. No qualifiers were applied.

- Holding Time Review: The aqueous samples were collected on 8/30/07, prepped on 9/18/07, and analyzed on 9/18/07 and 9/19/07. All holding time criteria were met. No qualifiers were applied.

II-Instrument Performance Check

LC/MS instrument performance checks are performed to ensure mass resolution, identification and, to some degree, sensitivity. The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed.

- The instrument performance check target compounds - $^{35}Cl^{16}O_3$, $^{37}Cl^{16}O_3$, and $^{35}Cl^{18}O_3$ - met the mass calibration criteria. No qualification was applied.

III-Initial and Continuing Calibration

Requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable quantitative data. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of the analysis run, and continuing calibration verification documents that the initial calibration is still valid.

Perchlorate:
1- blank (<1/2MRL DoD Perchlorate Handbook)
5 – standards (r≥0.995 DoD Perchlorate Handbook)
ICV (±15%D DoD Perchlorate Handbook)
CCV (±15%D DoD Perchlorate Handbook)
ICS, LODV (±30%D DoD Perchlorate Handbook)

- The perchlorate samples were analyzed on 9/18/07 and 9/19/07.

- Perchlorate was calibrated using a second order equation on 9/18/07, and had a correlation coefficient of 0.9998.

- The perchlorate recovery in LODV2 (74.2%) was above criteria, which the lab attributed to a positive interference at m/z 83. The six samples in this data set were analyzed immediately after LODV2, and the perchlorate results from all samples have been qualified "J/UJ" as estimated.

- All other ICVs, CCVs, ICSs, and LODVs were within criteria.

IV-Blanks

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. One method blank per analytical batch must be run on each instrument used to analyze samples. No contaminants should be detected in any of the associated blanks >MDL. The DoD Perchlorate Handbook criterion specifies all concentrations should be less than ½ MRL for method blanks. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤5 times (5X) the maximum amount for target compounds. **Table 2** summarizes the blank contamination analysis. Action levels are based upon dilution factor of one.

Table 2 Blank Contamination Analysis Summary

Analysis Date	Analysis	QC Blank ID	Max Conc. µg/L	Action Level µg/L	B qualified samples
9/18/07	Perchlorate	BL-259711-1	<½MRL	NA	None
9/18/07	Perchlorate	RB083007	<½MRL	NA	None

MRL = Method Reporting Limit.
NA = Not Applicable.

V-Internal Standards

Internal standard performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Internal standard area counts for samples and blanks must not vary by more than a factor of two (-50% to +100%) from the associated calibration standard. The DoD Handbook specifies relative retention times (RRT) of 1.0 ± 2% of last calibration standard. The mass ratio of ions 83:85 for each sample and standard should be 3.06, and must fall between 2.3 and 3.8 to confirm the presence of perchlorate. The laboratory 83:85 mass ratio limit range is 2.21 to 4.10.

- LODV1, LODV3, 50MW01, 48MW07, and 48MW06 did not meet the 83:85 mass ratio criteria. All results for these three samples have been qualified "J/UJ".

- All samples met area and RRT criteria, and all samples other than the three listed above met 83:85 mass ratio criteria.

VI-Laboratory Control Samples (LCS)

The laboratory control sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. DoD Perchlorate Handbook and laboratory aqueous limits are 85-115%.

- Sample QC-259711-1 was used as the aqueous LCS for perchlorate analysis on 9/18/07. All criteria were met. No qualifiers were applied.

VII-Matrix Spike (MS) and Spike Duplicate (MSD)

MS and MSD are generated to determine long-term accuracy and precision of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. Specific criteria include the analyses of matrix spike samples at a frequency of one MS/MSD per 20 samples of similar matrix. MS/MSD recoveries and relative percent differences between MS recoveries should be within the specified limits. DoD Perchlorate Handbook aqueous limits are 75-125%; RPD≤20%. The laboratory limits are 80-120%; RPD≤15%.

- Sample 48MW03 (F52170-5) was used for the MS/MSD analysis. All criteria were met. All samples were analyzed in conjunction with this MS/MSD.

VIII-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No field duplicates were included in this data set.

IX-Quantitation Verification
The accuracy of analytical results is verified through the calculation of several parameters. The percent difference (%D) between the calculated and the reported values should be within 10%. Any sample value >MDL and <MRL or <3*MDL (whichever was greater) was qualified as estimated, "J." The following calculations were performed for verification.

Sample: 48MW07 (F52208-3, 07E04544), Perchlorate

y (area ratio) = (Sample Area/Area EIC89) = (5222.35/77952) = 0.0670 = ax^2 + bx + c

solve for x
x = [-b ± SQRT(b^2-4ac)] / (2a)

where: x is the amount ratio

a = 0.0225735 b = 1.36878 c = - 0.0186592 - 0.0670 = -0.0856592

amount ratio ={-1.36878± [SQRT{(1.36878^2) – (4*0.0225735*-0.0856592)}] / (2*0.0225735)

Conc. µg/L = (Amount ratio * Is * DF)

where: Conc. = Sample concentration in ug/L
Is = Amount of internal standard (µg/L).
DF = Dilution factor

Conc. µg/L = (Amount ratio * Is * DF)
= (0.066246* 5 µg/L * 1) = 0.312 µg/L

Reported concentration = 0.313 µg/L
%D = 0.3%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Pesticides and PCBs
Accutest Laboratories, Inc., SDG F52208

DATE: October 30, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on August 30, 2007. Samples were analyzed for pesticides and PCBs using USEPA Methods 510C/8081A and 3510C/8082, respectively. A total of six aqueous samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
RB083007	F52208-1	50MW02	F52208-4
50MW01	F52208-2	48MW05	F52208-5
48MW07	F52208-3	48MW06	F52208-6

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Instrument Performance Check
	X	Initial Calibration
	X	Continuing Calibration
	X	Blank Analysis
X		System Monitoring Compounds
X		Laboratory Control Samples
X		Matrix Spike/Spike Duplicate
	X	Field Duplicate
	X	Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Richard McCracken

Richard McCracken, Chemist

Date

RFAAP VALIDATION REPORT
PESTICIDE/PCB REVIEW
SDG F52208

I-Holding Times and Preservation
The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. For aqueous samples, pesticide and PCB compounds are shipped @4°C ± 2°C, with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 8/30/07 were sent in 15 coolers, and were received by the laboratory on 8/31/07 at temperatures ranging from 0.6°C to 2.2°C, with 12 of the 15 coolers having temperatures below 2.0°C. The low sample temperatures are not expected to have an adverse impact on the analytical results. No qualifiers were applied.

- Holding Time Review: The samples were collected on 8/30/07, extracted for pesticides and PCBs on 9/6/07, analyzed for pesticides on 9/24/07, and analyzed for PCBs on 9/14/07. All criteria were met. No qualifiers were applied.

II-Instrument Performance Check (Degradation Standard)
Performance checks on the gas chromatograph with electron capture detector (GC/ECD) system are performed to ensure adequate resolution and instrument sensitivity. The performance evaluation mixture (PEM) must be analyzed at the beginning of the analytical sequence. The breakdown of Endrin and 4,4'-DDT must be ≤15% on both signals.

- For analysis performed on 9/24/07 @1450, endrin and 4,4'-DDT percent breakdowns were 9.6% and 4.8% on signal #1 and 8.4% and 4.1% on signal #2, respectively. All criteria were met. No qualifiers were applied.

III-Initial Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the target compounds. The initial 5 point calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run. Calibration factors are generated for each compound. The DoD QSM specifies that the percent relative standard deviation (%RSD) for all single peak target analytes, and aroclors 1016, 1242, 1254, and 1260 must be <20% or the mean %RSD for all analytes in the standard must be ≤20%. If linear regression is used, the correlation coefficient must be ≥0.990. All detects are qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits.

- During the pesticide initial calibration performed on 9/24/07 on instrument ECD5, all criteria were met. No qualifiers were applied. All samples were analyzed following this initial calibration.

- During the PCB initial calibration performed on 9/14/07 on instrument ECD3, all criteria were met. No qualifiers were applied. All samples were analyzed following this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for pesticide/PCB target compounds. Continuing calibration standards containing both target compounds and surrogates are analyzed at the beginning of each 12-hour analytical shift and after every 20 samples. The DoD QSM specifies that the percent difference (%D) or the average %Ds for all analytes in the standard from the calibration should be no greater than ±20%.

- During the pesticide initial calibration verification performed on 9/24/07 @1713 on instrument ECD5, all criteria were met. No qualifiers were applied. Samples RB083007, 50MW01, and 50MW02 were analyzed after this initial calibration verification.

- During the pesticide continuing calibration performed on 9/24/07 @2007 on instrument ECD5, all criteria were met. No qualifiers were applied. Samples RB083007, 50MW01, and 50MW02 were analyzed prior to this continuing calibration, while samples 48MW07, 48MW05, and 48MW06 were analyzed after this continuing calibration.

- During the pesticide continuing calibration performed on 9/24/07 @2158 on instrument ECD5, all criteria were met. No qualifiers were applied. Samples 48MW07, 48MW05, and 48MW06 were analyzed prior to this continuing calibration.

- During the PCB 1016/1260 initial calibration verification performed on 9/14/07 @1309 on instrument ECD3, peak #1 (21.1%) of aroclor 1016 had a %D >20% on signal #1, but the average of all 6 peaks was 13.8%. All other PCBs met criteria on signal #1, and all PCBs met criteria on signal #2. No qualifiers were applied. All samples were analyzed following this initial calibration verification.

- During the PCB 1016/1260 continuing calibration performed on 9/14/07 @1817 on instrument ECD3, all criteria were met. No qualifiers were applied. All samples were analyzed following this continuing calibration.

- During the PCB 1016/1260 continuing calibration performed on 9/14/07 @2148 on instrument ECD3, all criteria were met. No qualifiers were applied. All samples were analyzed prior to this continuing calibration.

V-Blank Analysis

The purpose of laboratory or field blank analyses is to determine the existence and magnitude of contamination problems resulting from laboratory or field activities. One method blank per analytical batch must be run on each instrument used to analyze samples. The DoD QSM criterion specifies all concentrations should be less than one-half MRL. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤5 times (5X) the maximum amount for pesticide and PCB target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Parameter	Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
Pesticides	9/24/07	OP22237-MB	All target <½MRL	NA	NA	None
Pesticides	9/24/07	RB083007	All target <½MRL	NA	NA	None
PCBs	9/14/07	OP22238-MB	All target <½MRL	NA	NA	None
PCBs	9/14/07	RB083007	All target <½MRL	NA	NA	None

NA = Not Applicable
MRL = Method Reporting Limit

VI-System Monitoring Compound (Surrogates)
Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Surrogate spikes are added to all samples and blanks to measure their recovery in sample and blank matrices. The percent recoveries (%Rs) must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Criteria:	Tetrachloro-m-xylene:	Pesticides: 42-127% (DoD QSM 25-140%)
	Decachlorobiphenyl:	Pesticides: 27-127% (DoD QSM 30-135%)
	Tetrachloro-m-xylene:	PCBs: 38-127% (DoD QSM Not Listed)
	Decachlorobiphenyl:	PCBs: 25-137% (DoD QSM 40-135%)

- Sample 50MW02 had low decachlorobiphenyl recoveries (27.8%, 27.6%) from both signals during pesticide analysis. The pesticide results from 50MW02 have been qualified "J/UJ" as estimated.

- All other samples met surrogate recovery criteria during pesticide analysis.

- Sample 50MW01 had a low decachlorobiphenyl recovery (37.4%) from signal #1 during PCB analysis. Tetrachloro-m-xylene was within criteria on both signals. No qualifiers are required when only one surrogate is outside criteria.

- Sample 50MW02 had low decachlorobiphenyl recoveries (25.5%, 28.3%) from both signals during PCB analysis. The PCB results from 50MW02 have been qualified "J/UJ" as estimated.

- Sample 48MW05 had low decachlorobiphenyl recoveries (33.9%, 37.9%) from both signals during PCB analysis. The PCB results from 48MW05 have been qualified "J/UJ" as estimated.

- All other samples met surrogate recovery criteria during PCB analysis.

VII-Laboratory Control Samples
Laboratory control samples (LCS) are used to monitor laboratory accuracy by calculating the percent recoveries of the spiked compounds. All LCS percent recoveries must be within the specified control limits. DoD QSM aqueous LCS recovery limits are specified in Table D-14 and Table D-16 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP22237-BS was used as the LCS during 9/24/07 pesticide analysis. Endrin aldehyde (16%) had a low recovery and was not detected in any field samples – the results have been qualified "UL" as estimated. All other pesticides met recovery criteria. All samples were analyzed in conjunction with this LCS.

- Sample OP22238-BS was used as the LCS during the 9/14/07 PCB analysis. All criteria were met. No qualifiers were applied.

VIII-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD aqueous MS/MSD recovery limits follow the LCS criteria and are specified in Table D-14 and Table D-16 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample 48MW07 was used for the pesticide MS/MSD analysis. Endrin aldehyde (15%, 14%) had a low recovery in the MS and MSD, as well as having a low recovery in the associated LCS. All sample results have already been qualified "UL", no further qualification is required. All other pesticides met criteria. All samples were analyzed in conjunction with this MS/MSD.

- Sample RB083007 was used for the PCB MS/MSD analysis. All criteria were met. No qualifiers were applied. All samples were analyzed in conjunction with this MS/MSD.

IX-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No field duplicates were included in this data set.

X-Quantitation Verification
The accuracy of analytical results was verified through the calculation of several parameters. The difference between the calculated value and the reported value must be within 10% difference. All positive values must have less than or equal to 40% %D between the primary and secondary columns. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J." All criteria were met.

Sample: 48MW07MSD, dieldrin

Conc. µg/L = (Ax * Vt * DF) / (CF * Vi * Vs *1000)

where: Ax = Area response for the compound being measured
Vt = Total volume of extract, taking into account dilutions (uL)
DF = Dilution factor
CF = Calibration Factor from initial calibration (area/pg)
Vi = Volume of extract injected (uL)
Vs = Volume of the sample extracted (mL)

Conc. µg/L = (5863511 * 1 * 10000) / (115500 * 510 * 1 * 1000)
= 1.0 ng/mL = 1.0 ug/L

Reported Conc. = 1.0 µg/L
%D = 0.0%
Values were within 10% difference

Sample: RB083007MS, Aroclor 1260

Conc. µg/L = (Ax * Vt * DF) / (CF * Vi * Vs * 1000)

where: Conc. = Sample concentration in µg/L
Ax = Area response for compound being measured.
Vt = Total volume of extract, taking into account dilutions (µL)
DF = Dilution factor
CF = Calibration factor from ICAL (area/pg)
Vi = Volume of extract injected (µL).
Vs = Volume of sample extracted (mL).

Signal #1
Conc1 µg/L = (3749063 * 10000* 1) / (9420 * 1 * 500 * 1000) = 7.96 µg/L
Conc2 µg/L = (4578443 * 10000* 1) / (11530 * 1 * 500 * 1000) = 7.94 µg/L
Conc3 µg/L = (4780110 * 10000* 1) / (12050 * 1 * 500 * 1000) = 7.93 µg/L
Conc4 µg/L = (3201148 * 10000* 1) / (8700 * 1 * 500 * 1000) = 7.36 µg/L
Conc5 µg/L = (7782711 * 10000* 1) / (20690 * 1 * 500 * 1000) = 7.52 µg/L
Conc6 µg/L = (4259347 * 10000* 1) / (12120 * 1 * 500 * 1000) = 7.03 µg/L
Average concentration = 7.6 µg/L

Reported Value = 7.6 µg/L (from signal #1)
% Difference = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥ MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

N (Metals) = Laboratory spike sample recovery not within control limits.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation – Semi-Volatiles & Polynuclear Aromatic Hydrocarbons Accutest Laboratories, Inc., SDG F52208

DATE: October 29, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on August 30, 2007. Samples were analyzed for semivolatile organic compounds (SVOCs) using USEPA SW846 Methods 3510C/8270C. The polynuclear aromatic hydrocarbons (PAHs) were analyzed using selective ion monitoring (SIM) techniques. A total of six aqueous samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
RB083007	F52208-1	50MW02	F52208-4
50MW01	F52208-2	48MW05	F52208-5
48MW07	F52208-3	48MW06	F52208-6

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Instrument Performance Check
	X	Initial Calibration
	X	Continuing Calibration
	X	Blank Analysis
	X	Surrogate Spikes
	X	Internal Standards
X		Laboratory Control Sample
	X	Matrix Spike/Spike Duplicate
	X	Field Duplicate
	X	Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Richard McCracken, Chemist

Date

RFAAP VALIDATION REPORT
SEMIVOLATILES AND PAH REVIEW
SDG F52208

I-Holding Times and Preservation
The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: For semivolatile (SVOC) and polynuclear aromatic hydrocarbons (PAH) compounds, the samples are cooled @4°C ± 2°C for aqueous samples with a maximum holding time of 7 days from sample collection to preparative extraction and 40 days from preparative extraction to determinative analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 8/30/07 were sent in 15 coolers, and were received by the laboratory on 8/31/07 at temperatures ranging from 0.6°C to 2.2°C, with 12 of the 15 coolers having temperatures below 2.0°C. The low sample temperatures are not expected to have an adverse impact on the analytical results. No qualifiers were applied.

- Holding Time Review: The aqueous samples were collected on 8/30/07, extracted for SVOCs on 9/6/07, extracted for PAHs by SIM on 9/6/07, analyzed for SVOCs on 9/15/07, and analyzed for PAHs by SIM on 9/20/07. All criteria were met. No qualifiers were applied.

II-Instrument Performance Check
GC/MS instrument performance checks are performed to ensure mass resolution, identification and, to some degree, sensitivity. The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed.

- The instrument performance check, decafluorotriphenylphosphine (DFTPP), met the ion abundance criteria. No qualification was applied.

III-Initial Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for compounds on the semivolatile target compound list (TCL). Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. For compounds analyzed using linear regression or second order, correlation coefficients must be >0.995 and coefficients of determination >0.99. The minimum relative response factor (RRF) criteria must be ≥0.05. The DoD QSM specifies that the initial calibration percent relative standard deviation (%RSD) must be ≤15% on the average for all compounds (<30% for CCCs). All detects are qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- Initial calibration for the SVOCs was performed on 9/14/07 using instrument GCMSR. Target compounds hexachlorocyclopentadiene (18.08%), 2,4-dinitrophenol (38.83%), and 4,6-dinitro-2-methylphenol (18.05%) had %RSDs outside criteria. All other target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). The compounds with high %RSD were quantified using second order regression, and had correlation coefficients >0.995; therefore no qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

- Initial calibration for the PAHs-SIM was performed on 9/20/07 using instrument GCMSR, all target compounds were within criteria (%RSD≤15% or ≤30%; RRF≥0.05). No qualifiers were applied. Naphthalene (r=0.9986) and dibenzo(a,h)anthracene (r=0.9993) were quantified using second order regression with correlation coefficients >0.995. All samples were analyzed in conjunction with this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used was capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Continuing calibration standards containing both target and surrogates compounds are analyzed at the beginning of each 12-hour analysis period following the analysis of the instrument performance check and prior to the analysis of blanks and samples. The minimum relative response factors (RRF) for semivolatile target compounds and surrogates must be ≥0.05. The DoD QSM specifies that the percent difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within ±20% for all target compounds. Grossly exceeding is defined where %D>40%. All detects are qualified as estimated "J" for where there were exceeding %Ds, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- During the SVOC initial calibration verification performed on 9/14/07 @1502 using instrument GCMSR, bis(2-chloroethoxy)methane (24.6%), 4-chloroaniline (26.6%), and 3-nitroaniline (29.7%) had %D outside criteria. All other target compounds met criteria. No samples were analyzed following this initial calibration verification, no qualifiers were applied.

- During the SVOC continuing calibration performed on 9/15/07 @1225 using instrument GCMSR, all criteria were met for all target compounds. No qualifiers were applied. All samples were analyzed following this continuing calibration.

- During the PAH-SIM initial calibration verification performed on 9/20/07 @1436 using instrument GCMSR, all criteria were met for all target compounds. No qualifiers were applied. No samples were analyzed following this initial calibration verification.

- During the PAH-SIM continuing calibration performed on 9/20/07 @1520 using instrument GCMSR, all criteria were met for all target compounds. No qualifiers were applied. All samples were analyzed following this continuing calibration.

V-Blank Analysis

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. A method blank analysis must be performed after the calibration standards and once every 12-hour time period beginning with the injection of DFTPP. No contaminants should be detected in any of the associated blanks > the MDL. DoD QSM criteria specifies all concentrations should be less than one-half MRL (<MRL for common laboratory contaminants phthalate esters). Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants phthalate esters, or 5 times (5X) the maximum amount for other semivolatile target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
9/15/07	OP22221-MB	All SVOC target <½MRL	NA	NA	None
9/20/07	OP22222-MB	All PAH SIM target <½MRL	NA	NA	None
9/15/07	RB083007	All SVOC target <½MRL	NA	NA	None
9/20/07	RB083007	All PAH SIM target <½MRL	NA	NA	None

NA = Not applicable.
MRL = Method reporting limit.

VI-Surrogate Spikes
Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Surrogate spikes are added to all samples and blanks to measure their recovery in sample and blank matrices. The percent recoveries (%Rs) must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-2 and Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Criteria:
2-Fluorophenol (14-62%) – (DoD QSM = 20-110%)
Phenol – d5 (10-40%) – (DoD QSM = 10-115%)
2,4,6-Tribromophenol (33-118%) – (DoD QSM = 40-125%)
Nitrobenzene-d5 (42-108%) – (DoD QSM = 40-110%)
2-Fluorobiphenyl (40-106%) – (DoD QSM = 50-110%)
p-Terphenyl – d14 (39-121%) – (DoD QSM = 50-135%)

- The MS had a high 2-fluorophenol (63.0%) recovery, while the MS and MSD had high phenol-d5 (56.0%, 56.0%) recoveries. The unspiked sample surrogate recoveries met criteria, no qualifiers were applied.

- All other field samples met surrogate recovery criteria. No qualifiers were applied.

VII-Internal Standards
Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Internal standard area counts for samples and blanks must not vary by more than a factor of two (-50% to +100%) from the associated calibration standard. The retention time of the internal standards in samples and blanks must not vary by more than ±30 seconds from the retention time of the associated calibration standard.

- All criteria were met. No qualifiers were applied.

VIII-Laboratory Control Sample
Laboratory control samples (LCS) are used to monitor laboratory accuracy by calculating the percent recoveries of the spiked compounds. All LCS percent recoveries must be within the specified control limits. DoD LCS aqueous recovery limits are specified in Table D-2 and Table D-6 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample OP22221-BS was used as the aqueous LCS for the SVOC analysis on 9/15/07. 1,3-Dichlorobenzene (37%) and 1,4-dichlorobenzene (39%) had recoveries below criteria. The results for these two compounds in the associated samples have been qualified "L/UL" as estimated. All other compounds were within criteria. All samples were analyzed in conjunction with this LCS.

- Sample OP22222-BS was used as the aqueous LCS for the PAH-SIM analysis on 9/20/07. All criteria were met. No qualifiers were applied. All samples were analyzed in conjunction with this LCS.

IX-Matrix Spike/Matrix Spike Duplicate
Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. DoD aqueous MS/MSD recovery limits follow the LCS criteria and are specified in Table D-2 and Table D-6 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample 50MW01 was used for the aqueous MS/MSD during SVOC analysis on 9/15/07. 4-Nitrophenol (60%, 60%) had high recoveries in the MS & MSD. All other compounds met criteria. The associated LCS met criteria for 4-nitrophenol, and it was not detected in any samples so no qualifiers were applied. All samples were analyzed in conjunction with this MS/MSD.

- Sample F52202-1 was used for the MS/MSD for the solid PAH SIM analysis on 9/20/07. The spiked sample was not a RFAAP site sample; therefore, it was not evaluated. All samples were analyzed in conjunction with this MS/MSD.

X-Field Duplicate Sample Analysis
Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No field duplicates were included in this data set.

XI-Quantitation Verification

The accuracy of analytical results was verified through the calculation of several parameters. Percent difference (%D) between the calculated and reported values must be ≤10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J."

Sample: 50MW02, bis(2-ethylhexyl)phthalate

Conc. (µg/L) = {(Ax)*(Is)*(Vt)*(DF)}/{(Ais)*(RRF)*(V_o)*(V_i)}

where:	$Conc_{sample}$	=	Sample concentration in µg/L
	A_x	=	Area of characteristic ion for compound being measured.
	I_s	=	Amount of internal standard injected (ng).
	V_t	=	Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10,000 µL.
	A_{is}	=	Area of characteristic ion for the internal standard.
	RRF_A	=	Average relative response factor for compound being measured
	V_o	=	Volume of water extracted (mL).
	V_i	=	Volume of extract injected (µL).
	DF	=	Dilution Factor

Conc. µg/L = (69077 * 40 * 1000 * 1) / (424945 * 0.797 * 1020 * 1) = 8 ng/mL
= 8 µg/L

Reported Value = 8 µg/L
% Difference = 0.0%
Values were within 10% difference.

Sample: OP22222-BS, bezno(a)pyrene

Conc. (µg/L) = {(Ax)*(Is)*(Vt)*(DF)}/{(Ais)*(RRF)*(V_o)*(V_i)}

where:	$Conc_{sample}$	=	Sample concentration in µg/L
	A_x	=	Area of characteristic ion for compound being measured.
	I_s	=	Amount of internal standard injected (ng).
	V_t	=	Volume of total extract, taking into account dilutions (i.e., a 1-to-10 dilution of a 1-mL extract will mean V(t) = 10,000 µL.
	A_{is}	=	Area of characteristic ion for the internal standard.
	RRF_A	=	Average relative response factor for compound being measured
	V_o	=	Volume of water extracted (mL).
	V_i	=	Volume of extract injected (µL).
	DF	=	Dilution Factor

Conc. µg/L = (80494 * 4 * 1000 * 1) / (116277 * 1.238 * 1000 * 1) = 2.2 ng/mL
= 2.2 µg/L

Reported Value = 2.2 µg/L
% Difference = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

MEMORANDUM

TO: Jeff Parks, Shaw E&I Radford Army Ammunition Plant (RFAAP) Project Manager

FROM: Richard McCracken, Shaw E&I Project Chemist

SUBJECT: RFAAP Data Validation - Volatiles
Accutest Laboratories, Inc., SDG F52208

DATE: October 29, 2007

The purpose of this memorandum is to present the data validation report for the samples collected at RFAAP on August 30, 2007. The samples were analyzed for target compound list (TCL) volatile organic compounds (VOCs) using USEPA SW846 Method 5030B/8260B. A total of seven aqueous samples were validated. The sample IDs are:

Field Sample ID	Lab Sample ID	Field Sample ID	Lab Sample ID
RB083007	F52208-1	48MW05	F52208-5
50MW01	F52208-2	48MW06	F52208-6
48MW07	F52208-3	TB083007	F52208-8
50MW02	F52208-4		

Data were reviewed by Richard McCracken and validated using a combination of project QAPP, *Quality Systems Manual for Environmental Laboratories, Final Version 3, January, 2006* (DoD, 2006) (DoD QSM), method-specific criteria, and laboratory SOP criteria. The data qualifier scheme was consistent with the *Region III Modifications to the National Functional Guidelines for Organic Data Review* (September 1994). Parameters evaluated are presented in **Table 1**. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

Table 1 Laboratory Performance Criteria

Qualified		Parameter
Yes	No	
	X	Holding Times and Preservation
	X	Instrument Performance Results
	X	Initial Calibration
	X	Continuing Calibration
	X	Blank Analysis
	X	Laboratory Control Sample
	X	Matrix Spike / Spike Duplicate Sample
	X	System Monitoring Compounds
	X	Internal Standards
	X	Field Sample Duplicate
X		Quantitation Verification

The quality of data collected in support of this sampling activity is considered acceptable with noted qualifications.

Date

RFAAP VALIDATION REPORT
VOLATILES REVIEW
SDG F52208

I-Holding Times and Preservation
The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of analysis. Holding time criteria: For aqueous samples cooled @ 4°C±2°C; pH<2 HCl, the maximum holding time is 14 days (7 days if no HCl added) from sample collection to analysis. For soil samples cooled @ 4°C±2°C; the maximum holding time is 14 days from sample collection to analysis.

- Temperature Review: A temperature blank was sent with each cooler and recorded by the laboratory upon receipt. The samples collected on 8/30/07 were sent in 15 coolers, and were received by the laboratory on 8/31/07 at temperatures ranging from 0.6°C to 2.2°C, with 12 of the 15 coolers having temperatures below 2.0°C. The low sample temperatures are not expected to have an adverse impact on the analytical results. No qualifiers were applied.

- Holding Time Review: The aqueous samples were collected for VOCs on 08/30/07 and analyzed on 9/13/07. All criteria were met. No qualifiers were applied.

II-Instrument Performance Check
The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed.

- The instrument performance check, bromofluorobenzene (BFB), met the ion abundance criteria. No qualification was applied.

III-Initial Calibration
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The RRF must be greater than 0.1 for chloromethane, 1,1-dichloroethane, and bromoform and greater than 0.3 for 1,1,2,2-tetrachloroethane and chlorobenzene. The minimum relative response factor (RRF) must be ≥0.05 for all other compounds. The DoD QSM specifies that the percent relative standard deviation (%RSD) must be ≤15% for each target compound and must be ≤30% for each calibration check compound. For compounds analyzed using linear regression or second order, correlation coefficients must be >0.995 and coefficients of determination >0.99. All detects are qualified as estimated "J" for where there were exceeding %RSDs, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- During the 9/7/07 initial calibration performed on instrument MSVOA4, target compounds acetone (15.12%), chloroethane (15.55%), 2-hexanone (20.41%), 4-methyl-2-pentanone (24.74%), methylene chloride (33.22%), and styrene (17.15%) were outside %RSD criteria. All other target compounds met %RSD criteria, and all compounds met RRF criteria. The compounds with high %RSD were quantified using second order regression, and had correlation coefficients >0.995; therefore, no qualifiers were applied. All samples were analyzed in conjunction with this initial calibration.

IV-Continuing Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Continuing calibration establishes the 12-hour relative response factors on which the quantitations are based and checks satisfactory performance of the instrument on a day-to-day basis. The RRF must be greater than 0.1 for chloromethane, 1,1-dichloroethane, and bromoform and greater than 0.3 for 1,1,2,2-tetrachloroethane and chlorobenzene. The minimum relative response factor (RRF) must be ≥0.05 for all other compounds. The DoD QSM specifies that the percent difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within 20% for all target compounds. All detects are qualified as estimated "J" for where there were exceeding %Ds, and all non-detects are qualified as estimated "UJ" for where there were grossly exceeding recoveries, unless determined to be unusable "R". Grossly exceeding is defined as twice the established criteria limits. For where there were low RRFs, all detects are qualified as estimated "J" and non-detects are rejected "R".

- During the initial calibration verification performed on 9/7/07 @1307 on instrument MSVOA4, acetone (31.6%) had a %drift outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). No samples were analyzed following this initial calibration verification, therefore no qualifiers were applied.

- During the continuing calibration performed on 9/13/07 @1030 on instrument MSVOA4, acetone (21.7%) had a %drift outside criteria. All other target compounds were within criteria (%D≤20%; %Drift≤20%; RRF≥0.05). No acetone was detected in any of the associated samples, so no data qualification was required. All samples were analyzed following this continuing calibration.

V-Blank Analysis

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. A method blank analysis must be performed after the calibration standards and once every 12-hour time period beginning with the injection of BFB. No contaminants should be detected in any of the associated blanks > the MDL. The DoD QSM criteria specifies all concentrations should be less than one-half MRL (<MRL for common laboratory contaminants methylene chloride, acetone, and 2-butanone). Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤10 times (10x) the maximum amount in any blank for the common laboratory contaminants methylene chloride, acetone, and 2-butanone (MEK), or 5 times (5X) the maximum amount for other volatile target compounds. **Table 2** summarizes the blank contamination analysis.

Table 2 Blank Contamination Analysis Summary

Analysis Date	QC Blank ID	Compound	Max Conc. µg/L	Action Level µg/L	B qualified samples
9/13/07	VB2036-MB	All target <½MRL	NA	NA	None
9/13/07	RB083007	All target <½MRL	NA	NA	None
9/13/07	TB083007	All target <½MRL	NA	NA	None

NA = Not Applicable
MRL = Method Reporting Limit

VI-Laboratory Control Sample

Data for laboratory control samples (LCS) are evaluated to determine long-term accuracy of the analytical method on various matrices. Percent recoveries (%Rs) should be within the specified control limits. The DoD aqueous LCS recovery limits are specified in Table D-4 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample VB2036-BS was used as the aqueous LCS for the VOC analysis on 9/13/07. Methyl chloride (143%) was above the DoD QSM criteria. No methyl chloride was detected in any samples, therefore no data qualifiers were applied. All other target compound recoveries were within criteria. All samples were analyzed in conjunction with this LCS.

VII-Matrix Spike/Matrix Spike Duplicate

Data for matrix spike/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits. The DoD MS/MSD aqueous recovery limits follow the LCS criteria and are specified in Table D-4 of the DoD QSM (DoD, 2006). If the compound is not listed, then the laboratory criteria shall be used.

- Sample RB083007 was used for the aqueous MS/MSD analysis on 9/13/07. Methyl chloride (150%, 141%) was above the DoD QSM criteria. No methyl chloride was detected in any samples, therefore no data qualifiers were applied. All other target compound recoveries were within criteria. All samples were analyzed in conjunction with this MS/MSD.

VIII-System Monitoring Compounds (Surrogates)

Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Recoveries for system monitoring compounds in volatile samples and blanks must be within the specified control limits. DoD surrogate recovery limits are specified in Table D-3 of the DoD QSM (DoD, 2006). If the surrogate is not listed, then the laboratory criteria shall be used.

Aqueous Criteria: Dibromofluoromethane (87-116%) (DoD QSM = 85-115%)
1,2-Dichloroethane-d4 (76-127%) (DoD QSM = 70-120%)
Toluene-d8 (86-112%) (DoD QSM = 85-120%)
4-Bromofluorobenzene (84-120%) (DoD QSM = 75-120%)

- All samples met criteria. No qualifiers were applied.

IX-Internal Standards (IS)

Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Specific criteria include: area counts (-50% to +100%) of the associated calibration standard, and retention time (± 30 seconds) from that of the associated calibration standard.

- All samples met criteria. No qualifiers were applied.

X-Field Duplicate Sample Analysis

Field duplicates were collected to identify the cumulative precision of the sampling and analytical process and sent to the laboratory blind. The RPD was calculated only for those analytes which were detected at levels exceeding the method reporting limits in both samples of the duplicate pair. Analytes that were rejected (R-qualified) in either sample of the duplicate pair were excluded from the duplicate assessment. Precision control criterion was established at 50% RPD for the aqueous and solid samples. Analytical results were qualified as estimated (J) for any RPDs exceeding criteria.

- No field duplicates were included in this sample set.

XI-Quantitation Verification

The accuracy of analytical results is verified through the calculation of several parameters. The percent difference (%D) between the calculated and the reported values should be within 10%. Any sample value >MDL and <MRL or <3*MDL (whichever is greater) was qualified as estimated, "J."

Sample: 50MW02 (F52208-4), trichloroethylene

Conc. (μg/L) = (Ax * Is * DF)/(Ais * RRF * Vo)

where: Ax is the compound area
Is is the amount of internal standard added (ng)
DF is the dilution factor
Ais is the internal standard area
RRF is the relative response factor
Vo is the volume of water purged (ml)

Conc. μg/L = (33658 * 250 μg/L * 1) / (1645049 * 0.304 *5) = 3.4 μg/L

Reported Conc. = 3.4 μg/L
%D = 0.0%
Values were within 10% difference.

USEPA Region III Validation Qualifiers

(No Code) = Confirmed identification.

B = The analyte has been detected in the sample and the associated laboratory or field blank.

J = Indicates an estimated value for (1) estimated value due to QC non-conformance. Reported value may not be accurate or precise, (2) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (3) estimating a concentration ≥MDL and <MRL or <3*MDL, whichever is greater.

K = Analyte present. Reported value may be biased high (estimated) due to QC non-conformance.

L = Analyte present. Reported value may be biased low (estimated) due to QC non-conformance.

R = Unreliable result. Analyte may or may not be present in the sample due to QC non-conformance.

UL = Value is estimated bias low and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise. Quantitation limit is probably higher.

UJ = Value is estimated and not detected due to QC non-conformance. Reporting limit may be inaccurate or imprecise.

Laboratory Qualifiers

(No Code) = Confirmed identification.

U = Not detected. The associated number indicates the compound reporting limit for the sample.

A (Dioxins) = B (Metals) = The reported value was obtained from a reading <MRL and ≥MDL and is considered estimated.

B (Organics) = The analyte or compound has been detected in the sample and laboratory method blank. It indicates probable blank contamination.

E (Metals) = Reported value is estimated because of the presence of interferences.

E (Organics) = Identifies compounds whose concentrations exceed the upper level of the calibration range.

EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).

D = Indicates sample was analyzed at a dilution.

J = Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <MRL and ≥ MDL.

N (Organics) = Indicates presumptive evidence of a compound for tentatively identified compounds using a library search.

N (Metals) = Laboratory spike sample recovery not within control limits.

P (Organics) = Target analyte confirmation >40% difference for detected compound between the primary and secondary columns. The lower of the two values was reported.

* (Metals) = Duplicate analysis not within control limits.

* (Organics) = Surrogate outside of QC limits on both original and re-analysis.

Contaminant Fate and Transport

CONTAMINANT FATE AND TRANSPORT

D.1 TRANSFORMATION AND FATE OF CONTAMINANTS

When contaminants are exposed to the environment, the potential for transformations of the chemical exists. The endpoint of the transformation process is referenced as the “fate” of the chemical. The ultimate "fate" refers to the expected final state that an element, compound, or group of compounds will achieve following release to the environment. The fate processes for organic contaminants may include sorption, volatilization, hydrolysis, and abiotic and biotic degradation, while the fate processes for inorganic contaminants may include ion exchange, chemical speciation, and oxidation/reduction. These fate processes dictate how contaminants will be transported in the environment. Contaminants can be transported with little attenuation or retardation due to these fate processes, or they can be delayed or transformed so that little migration occurs. Various fate processes, as well as the properties that may affect the fate of contaminants, are discussed below.

D.1.1 Contaminant Properties Affecting Fate

The physical and chemical properties of contaminants play a large role in determining their fate after release to the environment. The following section provides a discussion of several of these key properties.

D.1.1.1 Specific Gravity

Specific gravity is the ratio of the density of a compound to the density of water. It is a measure of the tendency of a compound to float (specific gravity <1) or sink (specific gravity >1) in water. Contaminants that are immiscible in water can exist as separate phase liquids and are referred to as Light Non-Aqueous Phase Liquids (LNAPLs) if their specific gravity is less than one, or Dense Non-Aqueous Phase Liquids (DNAPLs) if their specific gravity is greater than one.

D.1.1.2 Water Solubility

The solubility of a compound in water is the maximum or saturated concentration of the compound in pure water at a specific temperature. Compounds with high solubility in water tend to remain in the aqueous phase and not partition to soil or sediment, are less likely to volatilize from water, and are generally more likely to biodegrade. Conversely, compounds with a low water solubility tend to partition to soil or sediment, volatilize more readily from water, and are less likely to be biodegradable. The solubility of inorganic chemicals varies widely from insoluble to greater than 100,000 mg/L, depending on temperature, pH, ORP, and the concentrations of dissolved constituents such as humic and fulvic acids.

D.1.1.3 Vapor Pressure

Vapor pressure is a property of a chemical in its pure state, which indicates how readily it will volatilize to the atmosphere. Volatilization from water is dependent upon vapor pressure and Henry’s Law Constant. Vapor pressures for chemicals in their pure states range from 0.001 to 760 mm mercury (mm Hg) for liquids to less than 10^{-10} mm Hg for solids.

D.1.1.4 Henry's Law Constant

The Henry's Law Constant of a compound is essentially the air/water partition coefficient. In dimensional form, the Henry's Law Constant is the ratio of the vapor pressure to the water

solubility (in atm-m^3/mole). The Henry's Law Constant indicates how a chemical will partition between air and water at equilibrium, and can be used to calculate the rate of volatilization of a chemical from water.

D.1.1.5 Organic Carbon/Water Partition Coefficient

The organic carbon/water partition coefficient (K_{oc}) is a measure of the tendency for a chemical to be sorbed to the organic fraction of soil and sediment. Normal K_{oc} values range from 1 to 10^7 L/kg, with higher values indicating greater sorption potential by the soil and lower values indicating high leaching capabilities for the contaminants from the waste source into surface runoff and groundwater.

D.1.1.6 Octanol/Water Partition Coefficient

The octanol/water partition coefficient (K_{ow}) is a measure of the distribution of a compound at equilibrium between n-octanol and water. The octanol/water partition coefficient, K_{ow}, gives an indication of how a compound will preferentially distribute into a solvent or water, and is a measure of how hydrophobic a compound is. A chemical with a high K_{ow} is hydrophobic and may be relatively immobile in an aqueous system (e.g., contaminant sorbs to soil particles), but may be mobilized in the presence of an organic solvent.

D.1.2 Fate of Organic Contaminants

D.1.2.1 Sorption

Sorption and desorption are two major mechanisms affecting the fate of contaminants in the subsurface. Sorption includes both adsorption and absorption. Adsorption is defined as the accumulation occurring at an interface, while absorption is the partitioning between two phases (Knox et al., 1993).

Sorption is the process by which a compound is retained onto a solid particle rather than remaining dissolved in solution. The sorption of contaminants to the soil matrix is an important factor affecting their transport in terrestrial environments. The sorption of contaminants to suspended sediments and bottom sediment is an important factor affecting chemical transport in aquatic environments.

In general, sorption reactions may be classified as either sorbent or solvent-motivated. Sorbent-motivated sorption occurs when an attraction between the sorbent (subsurface material) and the solute (contaminant), and the contaminant accumulates at the surface due to the affinity of the surface for the contaminant. An example of sorbent-motivated sorption would be a highly polar or ionizable contaminant interaction with the cation exchange sites of clay minerals. This type of sorption typically occurs with inorganics and is more commonly referred to as ion exchange. Solvent-motivated sorption occurs when the contaminant is hydrophobic, such as nonpolar organics, which prefer nonpolar phases to the polar water phase. Hydrophobic contaminants will accumulate at an interface or partition into a nonpolar phase (e.g., associate with the organic content of the subsurface medium) rather than partition into the water phase. The sorption of most neutral organic constituents falls into the category of hydrophobic, or solvent-motivated sorption (Knox et al., 1993). The best indicators of the partitioning of a compound between soil and water are the organic carbon/water partition coefficient (K_{oc}), the soil/water distribution coefficient (K_d), the octanol/water partition coefficient (K_{ow}), and the retardation factor (R).

For nonionic organic chemicals and aquifer materials, sorption is largely controlled by the clay and organic carbon content of the soil. The distribution of an organic chemical between water

and a specific soil matrix is characterized by the organic carbon/water partition coefficient, K_{oc}. This coefficient, which is based on the specific organic carbon content of the soil, is typically measured empirically using a linear adsorption isotherm where the partitioning between the two phases is determined by the following equation (Olsen and Davis, 1990):

$$K_d = \frac{C_s}{C_w} \qquad \textit{Equation 1}$$

where:

K_d = Soil/water distribution coefficient (L/kg)
C_s = Mass of the solute on the solid phase per unit mass of the solid phase (mg/kg)
C_w = Mass of the solute per unit volume of solution (mg/L)

The soil/water distribution coefficient, K_d, obtained from the above equation is then normalized to correct for variations in the organic carbon content of differing soil matrices to calculate K_{oc}:

$$K_{oc} = \frac{K_d}{f_{oc}} \qquad \textit{Equation 2}$$

where:

K_{oc} = Organic carbon/water partition coefficient (L/kg)
K_d = Soil/water distribution coefficient (L/kg)
f_{oc} = Fraction of organic carbon in the soil

The normalization of the adsorption coefficient to ascertain K_{oc} correlates well with other adsorption coefficient estimation methods which use other properties of the chemical such as water solubility or octanol/water partitioning (Callahan et al., 1979).

If the empirical K_d or K_{oc} value for the chemical is not available, the most widely accepted method of estimating the organic carbon/water partition coefficient involves the octanol/water partition coefficient, K_{ow}. The octanol/water partition coefficient, K_{ow}, has been correlated to water solubility, the organic carbon/water partition coefficient, and bioconcentration factors for aquatic life and represents the extent of partitioning by a chemical between organic and aqueous phases (Lyman et al., 1990). The relationship between K_{oc} and K_{ow} is expressed as a regression equation:

$$\log K_{oc} = a \log K_{ow} + b \qquad \textit{Equation 3}$$

where a and b are constants derived from specific data sets which represent differing classes of chemicals such as pesticides, aromatic compounds, and chlorinated hydrocarbons. Chemicals with low K_{ow} (i.e., less than 10 L/kg) are considered relatively hydrophilic and tend to have high water solubilities and small K_{oc} values. Conversely, hydrophobic compounds typically have K_{ow} values greater than 10^4 L/kg (Lyman et al., 1990). In general, the more hydrophobic a contaminant is, the more likely the contaminant will be sorbed to soil.

From Equation 1, when C_s is equal to zero, K_d also equals zero. Under this condition, no adsorption or retardation of the chemical occurs. This implies that the contaminant moves at the same velocity as the groundwater and in this case, the contaminant is termed a conservative or nonreactive solute. However, the velocity of the contaminant front can be substantially different for solutes that are adsorbed within the soil matrix. The retardation factor is defined as the ratio of the groundwater flow velocity to the contaminant front velocity:

$$R = 1 + \rho_b \frac{K_d}{n_e} \qquad \textit{Equation 4}$$

where:

R	=	Retardation factor (dimensionless)
θ_b	=	Bulk density of the soil (g/mL)
K_d	=	Distribution coefficient (mL/g)
n_e	=	Effective porosity of the soil (dimensionless)

The retardation factor indicates the extent of retardation of contaminant migration in groundwater due to adsorption. A retardation factor of 1.0 indicates that the contaminant has little tendency to bind to soils and, hence, moves freely in the groundwater. By contrast, the larger the R, the greater the tendency for a contaminant to bind to the soil matrix and the slower it will move in the groundwater. The retardation factor cannot fall below 1.0.

Other factors which affect the adsorption of chemicals to the soil matrix include temperature, pH of the soil and water, particle size distribution, and surface area of solids. The value of the distribution coefficient K_d usually decreases with increasing temperature because adsorption is an exothermic process. Neutral and slightly polarized organic compounds are somewhat affected by pH. Chemicals that tend to ionize are significantly affected by pH (Lyman et al., 1990). When the pH of the groundwater is approximately 1.0 to 1.5 units above the negative log of the acid dissociation constant (pK_a), adsorption becomes significant. A comparison of the pK_a of an organic acid with the pH of the groundwater indicates the potential importance of the dissociation of the organic compound in determining the degree of partitioning. The size of affected soil particles also plays a role in a contaminant's sorption characteristics. Particles of small size, such as particles of fine silt or clay, will have a greater tendency to adsorb chemicals.

D.1.2.2 Volatilization

Volatilization is a process whereby a compound changes state from the aqueous phase to the vapor phase. Compounds that do not adsorb onto soil/sediment or dissolve in water have the greatest tendency to volatilize. The volatility of a compound can be evaluated from its K_{oc} and by assessing its Henry's Law Constant. The value of K_{oc} indicates the degree of sorption of a compound to soil/sediment. A compound with a high K_{oc} value will have a reduced volatility because the compound sorbs extensively to the soil/sediment surface. The Henry's Law Constant can be considered the partition coefficient of the contaminant between the aqueous phase and the gas phase. A Henry's Law Constant of greater than 10^{-3} atm-m^3/mol indicates a high volatility, and a Henry's Law Constant of less than 10^{-5} atm-m^3/mol indicates a low volatility. **Table D-1** provides a rough outline of relative volatility of a solute according to its Henry's Law Constant.

Table D-1
Volatility of Compounds Based on Henry's Law Constants

Volatility	Henry's Law Constant
Volatilization is very slow, at a rate controlled by slow diffusion through air	$< 10^{-5}$ atm-m^3/mol
Volatilization is not rapid but significant	10^{-5} atm-m^3/mol to 10^{-3} atm-m^3/mol
Volatilization is rapid	$> 10^{-3}$ atm-m^3/mol

The Henry's Law Constant is related to other physical properties of the compound, the most important of which are vapor pressure and water solubility. Compounds exhibiting a high vapor pressure and low water solubility tend to have high volatilization rates. In fact, in the absence of literature values, Henry's Law Constants can be estimated from the following equation (Olsen and Davis, 1990):

$$H = \frac{(V_p)(MW)(16.04)}{(WS)(T)} \qquad \textit{Equation 5}$$

where:

V_p = Vapor pressure of the chemical (mm Hg)
MW = Molecular weight of the chemical (g/mol)
WS = Solubility in water (mg/L)
T = Temperature (^oK)
H = Henry's Law Constant ([mg/L]/[mg/L])

From this equation, it is evident that the volatilization of a compound to air will depend on its vapor pressure, water solubility, and temperature. Other important factors affecting volatilization include wind speed, the depth of the aquifer, and the geology of the unsaturated zone.

D.1.2.3 Hydrolysis

Hydrolysis is the reaction of a compound with water. It usually involves the introduction of a hydroxyl (-OH) group into an organic compound, usually at a point of unbalanced charge distribution (Cherry et al., 1983). The hydrolysis reaction can displace halogens, and may be catalyzed by the presence of acids, bases, or metal ions. Therefore, the rate of hydrolysis is pH and metal-ion concentration dependent. Surface effects also may affect the rate of hydrolysis. Halogenated aliphatics are susceptible to hydrolysis, with reactions proceeding most rapidly for monohalogenated compounds, and much more slowly as the number of halogen ions increases (Fetter, 1993).

Hydrolysis applies to a limited number of chemicals. These contain hydrolyzable groups, such as esters, aliphatic halogens, amides, carbamates, and phosphate esters (Howard, 1991). Compounds that are not susceptible include: alkanes, alkenes, aldehydes, amines, and carboxy-containing compounds (Olsen and Davis, 1990).

D.1.2.4 Abiotic Degradation

Abiotic degradation is the chemical degradation of compounds without the assistance of biological activities. In the natural environment, the most common abiotic degradation processes are hydrolysis and hydroxyl radical reactions. Other abiotic degradation processes include direct photolysis, dehydrohalogenation, and oxidation.

Hydrolysis, as mentioned above, is a chemical reaction in which compounds react with water molecules in the environment, resulting in the introduction of a hydroxyl group (-OH) and the loss of a leaving group (-X), typically a halogen.

$$RX + H_2O \rightarrow ROH + HX \ (or\ H^+, X^-) \qquad Equation\ 6$$

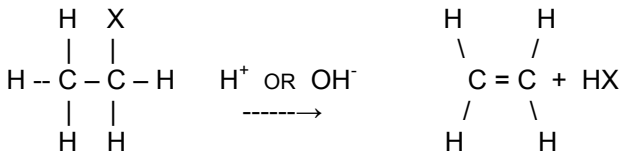
These reactions are catalyzed mainly by hydronium (H_3O^+) and/or hydroxyl ions (OH^-). Therefore, as mentioned above, hydrolysis reactions are pH dependent. Selected metals may also catalyze a hydrolysis reaction (Olsen and Davis, 1990).

Hydroxyl radical reactions are reactions with hydroxyl radicals photochemically generated from sunlight. These reactions may occur mostly in the atmosphere and to a lesser degree in surface water. Once the free radicals are formed, they will react with organic molecules to form an intermediate organic-free radical, which usually reacts further with other compounds. For most chemicals in the atmosphere, reaction with photochemically-generated hydroxyl radicals is the most common degradation process. For many chemicals, experimental reaction rate constants for reactions involving hydroxyl radicals are available in the scientific literature and are used to calculate an estimated half-life by assuming an average hydroxyl radical concentration of $5x10^5$ molecules/cm^3 in non-smog conditions (Howard, 1991).

Occasionally, other reactions besides hydroxyl radical reactions occur in the atmosphere such as ozone oxidation and direct photolysis. Direct photolysis is a photochemical alteration of the compound as a result of the compound absorbing direct sunlight. The possibility of direct photolysis in air or water can be partially assessed by examining the UV spectrum of the chemical. If the chemical does not absorb sunlight at wavelengths greater than 290 nm, the chemical cannot directly photolyze.

Dehydrohalogenation is an elimination reaction in which an alkyl derivative will eliminate HX to form an alkene, where X is commonly a halogen, hydroxyl radical, or ester group:

Equation 7



D.1.2.5 Biotic Degradation

Biodegradation is the process in which the chemical degradation of a compound is assisted by soil microorganisms (e.g., fungi, bacteria). Reactions include oxidation, reduction, hydrolysis, and sometimes rearrangement of the molecule. Though biodegradation may occur very slowly for some compounds, the eventual mineralization of almost every organic compound in the

terrestrial and aquatic environment can be attributed to biodegradation (Alexander, 1978). A typical range of half lives for different degradation rates are summarized in **Table D-2**.

Rates of biotic degradation depend on many factors. Microorganisms require a carbon source (e.g., organic matter), an electron acceptor (e.g., oxygen, nitrate), nutrients (e.g., nitrogen, phosphorus), and various trace elements in order to maintain existing cells and produce new cells. Many environmental factors can also serve to limit the occurrence of microbial metabolism in the subsurface. These factors include pH, temperature, toxics, substrate concentration, and the presence of microbes. Most bacteria find the optimum pH range to be 6.5 to 7.5 and are not able to survive at pH values greater than 9.5 or below 4.0 (Knox et al., 1993). Microbial activity generally increases with increasing temperature. The presence of certain compounds may also be toxic to microorganisms. Heavy metals, acids, bases, or high concentrations of the substrate can serve to limit microbial activity. Finally, for biotic degradation to occur in the subsurface, microbes capable of metabolizing (or cometabolizing) the substrate must be present.

Table D-2
Rate of Biodegradation Based on Half Lives

Biodegradation Rate	Approximate Biodegradation Half-Life
Fast	1 day to 7 days
Moderately Fast	7 days to 4 weeks
Slow	4 weeks to 6 months
Resistant	6 months to 1 year

Complete biotic degradation of organic chemicals by microorganisms, utilizing enzymes to facilitate degradation, ultimately produces microbial cells, water, and carbon dioxide, which eventually lead to mineralization of the compound. Whether or not a chemical is transformed by enzymes depends on the configuration alignment of the enzyme with the organic chemical during the reaction. If an ideal configuration of the enzyme with organic chemicals occurs, the reaction will occur. Persistent chemicals have less favorable alignments, and non-reacting or recalcitrant chemicals fail to bond or produce favorable alignments.

Biotic degradation can be either aerobic or anaerobic. An aerobic reaction occurs in the presence of oxygen. Aerobic reactions occur in oxygen-rich environments such as surface soil (i.e., 0 to 6 inches bgs) and upper layers of sediment. An aerobic reaction is usually an oxidation reaction. An anaerobic reaction occurs in the absence of oxygen. Anaerobic reactions occur in such places as the saturated zone in terrestrial environments and the bottom layer of sediment in aquatic environments. Because of the lack of oxygen in these environments, an anaerobic reaction usually favors dehydrohalogenation reactions or reductive reactions.

D.1.3 Fate of Inorganic Contaminants

D.1.3.1 Ion Exchange

Metals in soil are generally immobile, particularly under neutral or alkaline conditions, and tend to sorb to soil particles. As described in *Section D.1.2.1*, sorption can be considered as either

sorbent- or solvent-motivated. Solvent-motivated sorption (partitioning) typically occurs for nonpolar, hydrophobic organic chemicals in groundwater by accumulation occurring on the organic content of the media. Ion exchange is sorbent-motivated sorption and occurs for inorganic chemicals due to an affinity of the solid surface for the compound. Typically, the sorbent surface contains a charge deficiency and requires the accumulation of ions near the solid/liquid interface to neutralize the surface charge. In subsurface media, the mineral fraction most commonly involved in ion exchange is the clay fraction (Knox et al., 1993). Ion exchange occurs when the sorbent charge deficiency can be neutralized more efficiently by ions in solution than by those ions currently adsorbed. For example, if sodium ions (monovalent) have accumulated and calcium ions (divalent) suddenly appear, the excess surface charge can be more efficiently neutralized by the calcium ions than by sodium. Thus, the sodium ions will desorb, the calcium ions will adsorb, and an exchange of ions occurs. The cation exchange capacity of a given aquifer material indicates the probable type and amount of clay minerals present, and can be used as an indication of the ability of a soil to attenuate cations found in the groundwater (Makeig, 1982).

D.1.3.2 Chemical Speciation

Most inorganic chemicals occur in more than one ionic form, or species, in soils and groundwater. These species, which form as a result of hydrolysis, oxidation/reduction, and complexation reactions, may have different valences and mobilities in groundwater due to different affinities for adsorption and different solubility controls. Simple ionic species often combine with ligands to form ionic or neutral-charge aqueous complexes. The major inorganic ligands in groundwater are generally Cl^-, HCO_3^{-2}, CO_2, and SO_4^{-2}, and in some cases, NH_3, NO_3^- and F^- (Cherry et al., 1983). Environmental conditions which affect speciation of inorganic chemicals include pH, redox potential, and inorganic ligands.

D.1.3.3 Oxidation/Reduction

Oxidation and reduction ("redox") refers to the transfer of electrons and the resultant species change of ions or compounds. Oxidation is the loss of electrons, while reduction is the gain of electrons. Redox processes are important because they can cause changes in the mobility of many inorganic compounds. The ability of a redox reaction to occur is a function of the redox potential. The redox potential is defined in terms of the negative logarithm of the free-electron activity and is referred to as pE. The redox potential can also be expressed in terms of volts (E_h). Low values of pE indicate high electron activity and favor electron-rich species (reduced). High values of pE indicate low electron activity and favor electron-poor species (oxidized).

D.2 TRANSPORT OF CONTAMINANTS

Contaminant transport refers to the mechanisms and rates of migration of contaminants away from the source area. Migration pathways often include air, water, soil, and the interfaces between the phases of the contaminant (i.e., solid, liquid, or gas). Mechanisms controlling the movement of contaminants include advection, dispersion, diffusion, volatilization, and sorption. These mechanisms are dictated by the physical and chemical nature of the environmental media and their interaction with the potential COCs. Water pathways include surface water, storm water runoff, groundwater, infiltration/percolation, and precipitation. The air pathways include uptake into the atmosphere and deposition from it either in a dry or wet form. The soil pathways include sediment and soil transported by erosion or by site activities such as construction and movement through the vadose zone as soil gas. Transport across an interface is primarily due to

partitioning. The degree of partitioning will depend on the volatility, solubility, and sorptive capacity of the phases. The primary transport mechanisms across the water-air and soil-air interfaces are volatilization and sorption, while transport across the soil-water interface is controlled by sorption/desorption and dissolution (solubilization).

D.2.1 Advection

Contaminant transport by advection occurs when the contaminant is moved in and with the bulk flow of either water or the atmosphere. The primary advective transport pathway at Building 4343 is migration into surface water.

D.2.2 Diffusion

Transport by diffusion is the result of a concentration gradient in the contaminant plume or the soil gas within the vadose zone. The rate of diffusion is expressed by the diffusivity coefficient, which is affected by temperature, pressure, density, and soil porosity. Diffusion in soil is strongly dependent on the effective porosity of the soil. Residual clays have high porosity but low effective (interconnected) porosity. Transport due to diffusion in clays is usually minimal.

D.2.3 Volatilization

Volatilization occurs when a liquid changes its phase to a gas. This is primarily a mechanism for organic contaminants migrating from the soil or surface water to the air. Volatilization is a mass transfer process that is limited by a compound's solubility in water, molecular weight, vapor pressure, K_{oc} value, and by the local temperature.

D.2.4 Sorption

As discussed previously, sorption is a general term used in place of the specific terms absorption or adsorption. Adsorption describes the process whereby a contaminant is bound to the surface of a medium, whereas absorption occurs when the contaminant is bound within the medium. The distinction between the two is not always relevant, but the fact that a contaminant has been sorbed indicates that it has been bound to its new medium and will be transported with this new medium. This transport mechanism may be significant when a high concentration of suspended solids is found in water samples.

Desorption is the release (leaching) of a contaminant from the sorbent phase. Sorption/desorption is a primary mechanism of transport for water and soil pathways. In a water-soil environment, soil is the adsorbent and the contaminants are the adsorbates. Sorption/desorption of organic and inorganic compounds within soil-water systems is assessed by several physical and chemical properties of both the compound and the soil or sediment (*Section D.1.2.1*).

				Trespasser	Adolescent	Ingestion	On-site	None	Due to security at the installation, trespasser exposures are unlikely. However, the maintenance worker scenario would be protective of the limited exposures that would be experienced by a trespasser.
						Dermal	On-site	None	Due to security at the installation, trespasser exposures are unlikely. However, the maintenance worker scenario would be protective of the limited exposures that would be experienced by a trespasser.
		Air	SWMU 50	Maintenance Worker	Adult	Inhalation	On-site	Quant	Maintenance workers could be exposed to airborne volatiles or particulate matter released from surface soil at SWMU 50.
				Industrial Worker	Adult	Inhalation	On-site	Quant	Industrial workers could be exposed to airborne volatiles or particulate matter released from surface soil at SWMU 50.
				Trespasser	Adolescent	Inhalation	On-site	None	Due to security at the installation, trespasser exposures are unlikely. However, the maintenance worker scenario would be protective of the limited exposures that would be experienced by a trespasser.
	Total Soil (Surface and Subsurface)	Total Soil (Surface and Subsurface)	SWMU 50	Maintenance Worker	Adult	Ingestion	On-site	Quant	Maintenance workers could contact soil at SWMU 50 and be exposed to COPCs via incidental ingestion.
						Dermal	On-site	Quant	Maintenance workers could contact soil at SWMU 50 and be exposed to COPCs via dermal absorption.
				Industrial Worker	Adult	Ingestion	On-site	Quant	Industrial workers could contact soil at SWMU 50 and be exposed to COPCs via incidental ingestion.
						Dermal	On-site	Quant	Industrial workers could contact soil at SWMU 50 and be exposed to COPCs via dermal absorption.
				Excavation Worker	Adult	Ingestion	On-site	Quant	Excavation workers could contact soil at SWMU 50 and be exposed to COPCs via incidental ingestion.
						Dermal	On-site	Quant	Excavation workers could contact soil at SWMU 50 and be exposed to COPCs via dermal absorption.
				Resident	Adult	Ingestion	On-site	Quant	If SWMU 50 were to be further developed for residential purposes, residents could be exposed to COPCs in total soil via ingestion. The residential scenario is not considered to be a reasonably anticipated land use; however, it is being included in this e
						Dermal	On-site	Quant	If SWMU 50 were to be further developed for residential purposes, residents could be exposed to COPCs in total soil via dermal absorption.
					Child	Ingestion	On-site	Quant	If SWMU 50 were to be further developed for residential purposes, residents could be exposed to COPCs in total soil via ingestion. The residential scenario is not considered to be a reasonably anticipated land use; however, it is being included in this e
						Dermal	On-site	Quant	If SWMU 50 were to be further developed for residential purposes, residents could be exposed to COPCs in total soil via dermal absorption.

Table E.1-1
Selection of Exposure Pathways - SWMU 50

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	On-Site/ Off-Site	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Future (cont.)	Total Soil (Surface and Subsurface)	Total Soil (Surface and Subsurface)		Trespasser	Adolescent	Ingestion	On-site	None	Given the industrial nature of the site, trespasser exposures are unlikely. However, the maintenance worker scenario would be protective of the limited exposures that would be experienced by a trespasser.
						Dermal	On-site	None	Given the industrial nature of the site, trespasser exposures are unlikely. However, the maintenance worker scenario would be protective of the limited exposures that would be experienced by a trespasser.
		Air	SWMU 50	Maintenance Worker	Adult	Inhalation	On-site	Quant	Maintenance workers could be exposed to airborne volatiles or particulate matter released from soils at SWMU 50.
				Industrial Worker	Adult	Inhalation	On-site	Quant	Industrial workers could be exposed to airborne volatiles or particulate matter released from soils at SWMU 50.
				Excavation Worker	Adult	Inhalation	On-site	Quant	Excavation workers could be exposed to airborne volatiles or particulate matter released from soils at SWMU 50.
				Resident	Adult	Inhalation	On-site	Quant	If SWMU 50 were to be further developed for residential purposes, residents could be exposed to airborne volatiles or particulate matter released from total soil.
					Child	Inhalation	On-site	Quant	If SWMU 50 were to be further developed for residential purposes, residents could be exposed to airborne volatiles or particulate matter released from total soil.
				Trespasser	Adolescent	Inhalation	On-site	None	Given the industrial nature of the site, trespasser exposures are unlikely. However, the maintenance worker scenario would be protective of the limited exposures that would be experienced by a trespasser.
	Groundwater	Groundwater	SWMU 50	Maintenance Worker	Adult	Ingestion	On-site	None	Maintenance workers would not contact groundwater at SWMU 50.
						Dermal	On-site	None	Maintenance workers would not contact groundwater at SWMU 50.
				Industrial Worker	Adult	Ingestion	On-site	Quant	If SWMU 50 were to be further developed for industrial purposes and groundwater wells were installed at the site, site workers could be exposed to COPCs in groundwater via ingestion. The groundwater pathways for SWMUs 48, 49, 50 and 59 have been addressed in a separate RFI/CMS for SWMUs 48 and 49.
						Dermal	On-site	None	Although site worker dermal exposures to groundwater could occur, the exposed body surface area of a worker (i.e., hands and arms) would be small and exposures would be infrequent.
				Excavation Worker	Adult	Ingestion	On-site	None	Based on the depth to groundwater, excavation workers would not contact groundwater at SWMU 50.
						Dermal	On-site	None	Based on the depth to groundwater, excavation workers would not contact groundwater at SWMU 50.
				Resident	Adult	Ingestion	On-site	Quant	If SWMU 50 were to be further developed for residential purposes, residents could be exposed to COPCs in groundwater via ingestion. The residential scenario is not considered to be a reasonably anticipated land use; however, it is being included in this evaluation to meet "clean closure" requirements under RCRA. The groundwater pathways for SWMUs 48, 49, 50 and 59 have been addressed in a separate RFI/CMS for SWMUs 48 and 49.
						Dermal	On-site	Quant	If SWMU 50 were to be further developed for residential purposes, residents could be exposed to COPCs in groundwater via dermal absorption. The groundwater pathways for SWMUs 48, 49, 50 and 59 have been addressed in a separate RFI/CMS for SWMUs 48 and 49.

Table E.1-1
Selection of Exposure Pathways - SWMU 50

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	On-Site/ Off-Site	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Future (cont.)	Groundwater (cont.)	Groundwater	SWMU 50		Child	Ingestion	On-site	Quant	If SWMU 50 were to be further developed for residential purposes, residents could be exposed to COPCs in groundwater via ingestion. The residential scenario is not considered to be a reasonably anticipated land use; however, it is being included in this evaluation to meet "clean closure" requirements under RCRA. The groundwater pathways for SWMUs 48, 49, 50 and 59 have been addressed in a separate RFI/CMS for SWMUs 48 and 49.
						Dermal	On-site	Quant	If SWMU 50 were to be further developed for residential purposes, residents could be exposed to COPCs in groundwater via dermal absorption. The groundwater pathways for SWMUs 48, 49, 50 and 59 have been addressed in a separate RFI/CMS for SWMUs 48 and 49.
				Trespasser	Adolescent	Ingestion	On-site	None	Due to security at the installation, trespasser exposures are unlikely.
						Dermal	On-site	None	Due to security at the installation, trespasser exposures are unlikely.
		Homegrown fruits and vegetables	SWMU 50	Resident	Adult	Ingestion	On-site	Quant	Residents could ingest COPCs in groundwater that had been taken up by homegrown fruits and vegetables. The groundwater pathways for SWMUs 48, 49, 50 and 59 have been addressed in a separate RFI/CMS for SWMUs 48 and 49.
					Child	Ingestion	On-site	Quant	Residents could ingest COPCs in groundwater that had been taken up by homegrown fruits and vegetables. The groundwater pathways for SWMUs 48, 49, 50 and 59 have been addressed in a separate RFI/CMS for SWMUs 48 and 49.
		Air	Volatile groundwater COPCs released to ambient air	Maintenance Worker	Adult	Inhalation	On-site	Quant	Volatiles could be released from groundwater into ambient air. Maintenance workers could be exposed via inhalation. The groundwater pathways for SWMUs 48, 49, 50 and 59 have been addresses in a separate RFI/CMS for SWMUs 48 and 49.
			Indoor Vapors	Industrial Worker	Adult	Inhalation	On-site	Quant	Volatiles in groundwater could potentially migrate into buildings via vapor intrusion. The groundwater pathways for SWMUs 48, 49, 50 and 59 have been addressed in a separate RFI/CMS for SWMUs 48 and 49.
			Trench Vapors	Excavation Worker	Adult	Inhalation	On-site	Quant	Volatiles in groundwater could potentially migrate into a construction or utility trench via vapor intrusion. The groundwater pathways for SWMUs 48, 49, 50 and 59 have been addressed in a separate RFI/CMS for SWMUs 48 and 49.
			Volatiles at Showerhead	Resident	Adult	Inhalation	On-site	Quant	If groundwater wells were installed for residential purposes, adult residents could contact volatiles in groundwater via showering. The groundwater pathways for SWMUs 48, 49, 50 and 59 have been addressed in a separate RFI/CMS for SWMUs 48 and 49.
					Child	Inhalation	On-site	None	Children are assumed to bathe rather than shower. Therefore, inhalation exposure is assessed using only indoor air.
			Indoor Vapors	Resident	Adult	Inhalation	On-site	Quant	Volatiles in groundwater could potentially migrate into residences via vapor intrusion. The groundwater pathways for SWMUs 48, 49, 50 and 59 have been addressed in a separate RFI/CMS for SWMUs 48 and 49.
					Child	Inhalation	On-site	Quant	Volatiles in groundwater could potentially migrate into residences via vapor intrusion. The groundwater pathways for SWMUs 48, 49, 50 and 59 have been addressed in a separate RFI/CMS for SWMUs 48 and 49.
			Volatile groundwater COPCs released to ambient air	Trespasser	Adolescent	Inhalation	On-site	None	Due to security at the installation, trespasser exposures are unlikely. However, the maintenance worker scenario would be protective of the limited exposures that would be experienced by a trespasser.

Table E.1-1
Selection of Exposure Pathways - SWMU 50

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	On-Site/ Off-Site	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Future (cont.)	Groundwater	Groundwater	Off-site	Resident	Adult	Ingestion	Off-site	Quant	If COPCs from SWMU 50 groundwater were to migrate off-site in the future, off-site residents could be exposed to COPCs in groundwater via ingestion. See RFI/CMS for SWMUs 48 and 49.
						Dermal	Off-site	Quant	If COPCs from SWMU 50 groundwater were to migrate off-site in the future, off-site residents could be exposed to COPCs in groundwater via dermal absorption. See RFI/CMS for SWMUs 48 and 49.
					Child	Ingestion	Off-site	Quant	If COPCs from SWMU 50 groundwater were to migrate off-site in the future, off-site residents could be exposed to COPCs in groundwater via ingestion. See RFI/CMS for SWMUs 48 and 49.
						Dermal	Off-site	Quant	If COPCs from SWMU 50 groundwater were to migrate off-site in the future, off-site residents could be exposed to COPCs in groundwater via dermal absorption. See RFI/CMS for SWMUs 48 and 49.
				Trespasser	Adolescent	Ingestion	Off-site	None	The residential scenario would be protective of the limited exposures that would be experienced by a trespasser.
						Dermal	Off-site	None	The residential scenario would be protective of the limited exposures that would be experienced by a trespasser.
		Homegrown fruits and vegetables	Off-site	Resident	Adult	Ingestion	Off-site	Quant	If COPCs from SWMU 50 groundwater were to migrate off-site in the future, off-site residents could ingest COPCs in groundwater that had been taken up by homegrown fruits and vegetables. See RFI/CMS for SWMUs 48 and 49.
					Child	Ingestion	Off-site	Quant	If COPCs from SWMU 50 groundwater were to migrate off-site in the future, off-site residents could ingest COPCs in groundwater that had been taken up by homegrown fruits and vegetables. See RFI/CMS for SWMUs 48 and 49.
		Air	Volatile groundwater COPCs released to ambient air	Maintenance Worker	Adult	Inhalation	Off-site	Quant	If COPCs from SWMU 50 groundwater were to migrate off-site in the future, volatiles could be released from groundwater into ambient air. Off-site maintenance workers could be exposed via inhalation. See RFI/CMS for SWMUs 48 and 49.
			Indoor Vapors	Industrial Worker	Adult	Inhalation	Off-site	Quant	If COPCs from SWMU 50 groundwater were to migrate off-site in the future, volatiles in groundwater could potentially migrate into off-site buildings via vapor intrusion. See RFI/CMS for SWMUs 48 and 49.
			Trench Vapors	Excavation Worker	Adult	Inhalation	Off-site	Quant	If COPCs from SWMU 50 groundwater were to migrate off-site in the future, volatiles in groundwater could potentially migrate into an off-site construction or utility trench via vapor intrusion. See RFI/CMS for SWMUs 48 and 49.
			Volatiles at Showerhead	Resident	Adult	Inhalation	Off-site	Quant	If COPCs from SWMU 50 groundwater were to migrate to off-site wells in the future, adult residents could contact volatiles in groundwater via showering. See RFI/CMS for SWMUs 48 and 49.
					Child	Inhalation	Off-site	None	Children are assumed to bathe rather than shower. Therefore, inhalation exposure is assessed using only indoor air.
			Indoor Vapors	Resident	Adult	Inhalation	Off-site	Quant	If COPCs from SWMU 50 groundwater were to migrate off-site in the future, volatiles in groundwater could potentially migrate into off-site residences via vapor intrusion. See RFI/CMS for SWMUs 48 and 49.
					Child	Inhalation	Off-site	Quant	If COPCs from SWMU 50 groundwater were to migrate off-site in the future, volatiles in groundwater could potentially migrate into off-site residences via vapor intrusion. See RFI/CMS for SWMUs 48 and 49.
			Volatile groundwater COPCs released to ambient air	Trespasser	Adolescent	Inhalation	Off-site	None	The maintenance worker scenario would be protective of the limited exposures that would be experienced by a trespasser.

	7440-66-6	Zinc	1.70E+01 J	9.33E+01 J	mg/kg	50SS02	14/14	N/A	9.33E+01	N/A	2.30E+03 (N)	N/A	N/A	No	BSL

(1) Maximum concentration used for screening.

(2) N/A - Refer to supporting information for background discussion.
Background values derived from site-specific statistical analysis. See text for supporting information.

(3) Screening level values for residential soil from USEPA Regional Screening Level Table (September 2008) are based on a risk level of 1.0E-06 and a hazard index of 0.1. See text for derivation of Nutrient RDAs.

(4) Rationale Codes
Selection Reason:
Infrequent Detection but Associated Historically (HIST)
Toxicity Information Available (TX)
Above Screening Levels (ASL)
No Toxicity Information (NTX)
Deletion Reason:
Background Levels (BKG)
Below Screening and/or ARAR/TBC Level (BSL)

Definitions:
N/A = Not Applicable or Not Available
SQL = Sample Quantitation Limit
COPC = Chemical of Potential Concern
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered
MCL = Federal Maximum Contaminant Level
SMCL = Secondary Maximum Contaminant Level
J = Estimated Value
C = Carcinogenic
N = Non-Carcinogenic
RDA = Recommended Daily Allowance

(5) The screening value for 1,3-dichlorobenzene is based on 1,4-dichlorobenzene.

(6) The screening value for dinitrotoluene mixture is based on carcinogenicity study for 2,4-DNT and 2,6-DNT. Therefore, the RBC for dinitrotoluene mixture is conservatively used as the screening value for the individual compounds.

(7) The screening value for pyrene was used as a surrogate.

(8) The screening value for endosulfan II is based on endosulfan.

(9) The screening value for mercury is based on mercury, inorganic salts.

(10) The screening value for vanadium is based on vanadium and compounds.

Table E.1-3

(1) Maximum concentration used for screening.

(2) N/A - Refer to supporting information for background discussion.
Background values derived from site-specific statistical analysis. See text for supporting information.

(3) Screening toxicity values for residential soil from USEPA Regional Screening Level Table (September 2008) and based on a risk level of 1.0E-06 and a hazard index of 0.1. See text for derivation of Nutrient RDAs.

(4) The screening value is based on p-cresol.

(5) The screening value is based on chlordane.

(6) The screening value is based on endosulfan.

Table E.1-3
Summary of Screening for Non-Detected Chemicals
Current/Future - Surface Soil at SWMU 50

Scenario Timeframe: Current/Future
Medium: Soil
Exposure Medium: Surface Soil

Exposure Point	CAS Number	Chemical	Minimum Concentration (Qualifier)	Maximum Concentration (Qualifier)	Units	Location of Maximum Concentration	Detection Frequency	Range of Detection Limits	Concentration Used for Screening (1)	Background Value (2)	Screening Toxicity Value (3) (N/C)	Max ND greater than Screening Value? (Y/N)

(7) The screening value is based on endrin.

(8) The screening value is based on dinitrotoluene mixtures.

(9) The screening value is based on 1,3-dichloropropene.

(1) Maximum concentration used for screening.

(2) N/A - Refer to supporting information for background discussion.
Background values derived from site-specific statistical analysis. See text for supporting information.

(3) Screening level values for residential soil from USEPA Regional Screening Level Table (September 2008) are based on a risk level of 1.0E-06 and a hazard index of 0.1. See text for derivation of Nutrient RDAs.

(4) Rationale Codes
Selection Reason:
Infrequent Detection but Associated Historically (HIST)
Toxicity Information Available (TX)
Above Screening Levels (ASL)
No Toxicity Information (NTX)
Deletion Reason:
Background Levels (BKG)
Below Screening and/or ARAR/TBC Level (BSL)

Definitions:
N/A = Not Applicable or Not Available
SQL = Sample Quantitation Limit
COPC = Chemical of Potential Concern
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered
MCL = Federal Maximum Contaminant Level
SMCL = Secondary Maximum Contaminant Level
J = Estimated Value
C = Carcinogenic
N = Non-Carcinogenic
RDA = Recommended Daily Allowance

(5) The screening value for 1,3-dichlorobenzene is based on 1,4-dichlorobenzene.

(6) The screening value for dinitrotoluene mixture is based on carcinogenicity study for 2,4-DNT and 2,6-DNT. Therefore, the RBC for dinitrotoluene mixture is conservatively used as the screening value for the individual compounds.

(7) The screening value for pyrene was used as a surrogate.

(8) The screening value for endosulfan II is based on endosulfan.

(9) The screening value for mercury is based on mercury, inorganic salts.

(10) The screening value for vanadium is based on vanadium and compounds.

Table E.1-5
Summary of Screening for Non-Detected Chemicals
Current/Future - Total Soil at SWMU 50

Scenario Timeframe: Current/Future
Medium: Soil
Exposure Medium: Total Soil

Exposure Point	CAS Number	Chemical	Minimum Concentration (Qualifier)	Maximum Concentration (Qualifier)	Units	Location of Maximum Concentration	Detection Frequency	Range of Detection Limits	Concentration Used for Screening (1)	Background Value (2)	Screening Toxicity Value (3) (N/C)	Max ND greater than Screening Value? (Y/N)

	108-88-3	Toluene			mg/kg		0/30	4.90E-03 - 4.00E-01	4.00E-01	N/A	5.00E+02 (N)	No
	10061-02-6	trans-1,3-Dichloropropene (8)			mg/kg		0/30	4.90E-03 - 1.00E+00	1.00E+00	N/A	1.70E+00 (C)	No
	75-25-2	Tribromomethane			mg/kg		0/30	4.90E-03 - 3.00E+00	3.00E+00	N/A	6.10E+01 (C)	No
	79-01-6	Trichloroethene			mg/kg		0/30	4.90E-03 - 1.00E+00	1.00E+00	N/A	2.80E+00 (C)	No
	75-01-4	Vinyl Chloride			mg/kg		0/30	4.90E-03 - 3.00E+00	3.00E+00	N/A	6.00E-02 (C)	Yes
	1330-20-7	Xylenes (total)			mg/kg		0/2	8.00E-01 - 8.00E-01	8.00E-01	N/A	6.00E+01 (N)	No

(1) Maximum concentration used for screening.

(2) N/A - Refer to supporting information for background discussion.
Background values derived from site-specific statistical analysis. See text for supporting information.

(3) Screening toxicity values for residential soil from USEPA Regional Screening Level Table (September 2008) and based on a risk level of 1.0E-06 and a hazard index of 0.1. See text for derivation of Nutrient RDAs.

(4) The screening value is based on p-cresol.

(5) The screening value is based on chlordane.

Table E.1-5
Summary of Screening for Non-Detected Chemicals
Current/Future - Total Soil at SWMU 50

Scenario Timeframe: Current/Future
Medium: Soil
Exposure Medium: Total Soil

Exposure Point	CAS Number	Chemical	Minimum Concentration (Qualifier)	Maximum Concentration (Qualifier)	Units	Location of Maximum Concentration	Detection Frequency	Range of Detection Limits	Concentration Used for Screening (1)	Background Value (2)	Screening Toxicity Value (3) (N/C)	Max ND greater than Screening Value? (Y/N)

(6) The screening value is based on endosulfan.

(7) The screening value is based on endrin.

(8) The screening value is based on 1,3-dichloropropene.

Table E.1-6
Medium-Specific Exposure Point Concentration Summary for SWMU 50 Surface Soil

Scenario Timeframe: Current/Future
Medium: Soil
Exposure Medium: Surface Soil

Exposure Point	Chemical of Potential Concern	Units	Arithmetic Mean of Detects	Multiple Detection Limits? (Yes/No) [1]	95% UCL (Distribution) [2]	Maximum Concentration	Exposure Point Concentration			
							Value	Units	Statistic [3]	Rationale [4]
Surface Soil	2,3,7,8-TCDD-TE	mg/kg	2.67E-05	No	6.17E-05 (G)	9.60E-05	6.17E-05	mg/kg	95% Approx. Gamma	Test (6)
	2,4-Dinitrotoluene	mg/kg	3.93E-01	Yes	4.44E-01 (N)	8.88E-01	4.44E-01	mg/kg	95% KM-% Btstrp	Test (1)

	Iron	mg/kg	1.95E+04	No	2.21E+04 (N)	2.83E+04	2.21E+04	mg/kg	95% Student's-t	Test (4)
	Manganese	mg/kg	6.96E+02	No	8.73E+02 (N)	1.32E+03	8.73E+02	mg/kg	95% Student's-t	Test (4)
	Vanadium	mg/kg	3.81E+01	No	4.25E+01 (N)	4.91E+01	4.25E+01	mg/kg	95% Student's-t	Test (4)

Notes: N/A = Not applicable

[1] ProUCL software (version 4.0, USEPA, 2007) recommends use of Kaplan-Meier method if there are multiple detection limits.

[2] Statistical Distribution and 95% UCL as determined by ProUCL (unless otherwise noted): (G) the data were determined to follow gamma distribution; (L) the data were determined to follow lognormal distribution; (NP) the data were determined to be non-parametric; (N) the data were determined to be normally distributed.

[3] Statistic: Maximum Detected Value (Max); 95% KM Chebyshev (95% KM-Cheby); 97.5% KM Chebyshev (97.5% KM-Cheby); 99% KM Chebyshev (99% KM-Cheby); 95% KM Percentile Bootstrap (95% KM-% Btstrp); 95% KM-t (95% KM-t); 95% KM-BCA (95% KM-BCA); 95% H-UCL (95% H-UCL); 95% Chebyshev -Mean, SD- UCL (95% Cheby, Mean, SD); 97.5% Chebyshev -Mean, SD- UCL (97.5% Cheby, Mean, SD); 99% Chebyshev -Mean, SD- UCL (99% Cheby, Mean, SD); 95% UCL of Log-transformed Data (95% UCL-T) 95% Student's-t (95% Student's-t); 95% Modified-t (95% Modified-t); 95% UCL based on bootstrap statistic (95% UCL-Bst); 95% Approximate Gamma UCL (95% Approx. Gamma); 95% KM Chebyshev-MVUE (95% KM-Cheby-MVUE).

[4] Unless otherwise noted (see footnote 5), ProUCL EPC selection rationale based on, detection limit values, distribution, standard deviation, and sample size (see ProUCL output in appendix for further details):

Test (1): Kaplan-Meier method recommended by ProUCL due to multiple detection limits.

Test (2): The 95% UCL exceeds the maximum detected concentration, therefore, maximum concentration used for EPC.

Test (3): Shapiro-Wilk W test, Kolmogorov-Smirnov (K-S), and Anderson-Darling (A-D) tests, indicate data follow nonparametric distribution.

Test (4): Shapiro-Wilk W test indicates data are normally distributed.

Test (5): Shapiro-Wilk W test indicates data are log-normally distributed.

Test (6): Kolmogorov-Smirnov (K-S) and/or Anderson-Darling (A-D) tests indicate data follow gamma distribution.

Table E.1-6
Medium-Specific Exposure Point Concentration Summary for SWMU 50 Surface Soil

Exposure Point	Chemical of Potential Concern	Units	Arithmetic Mean of Detects	Multiple Detection Limits? (Yes/No) [1]	95% UCL (Distribution) [2]	Maximum Concentration	Exposure Point Concentration			
							Value	Units	Statistic [3]	Rationale [4]

Test (7): Sample size is less than or equal to 5, therefore, maximum concentration used for EPC.

Test (8): 95% UCL estimated by a non-Pro-UCL bootstrap method.

[5] Infrequent detection resulted in ProUCL modeling error for this constituent, therefore the distribution was assumed to be non-parametric and the UCL was determined using a non-ProUCL bootstrap method with random numbers for NDs (see text for details).

				CF2	Conversion Factor 2	365	days/year	---	

(1) Best professional judgement. Based on site maintenance/inspection activities conducted 1day/week and assuming 2 weeks on vacation.
(2) Dermal absorption factors are presented in **Table E.1-14**.
(3) Value derived from data presented in USEPA (1997), averaging across gender and age. It is assumed that head, hands, and forearms are exposed to surface soil.

USEPA, 1995: Assessing Dermal Exposure from Soil Hazardous Waste Management Division. Office of Superfund Programs, Region III, Philadelphia, PA.
USEPA, 1997: Exposure Factors Handbook, Volume I. EPA/600/P-95/002Fa.
USEPA, 2002: Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites. OSWER 9355.4-24.
USEPA, 2003: Updated Dermal Exposure Assessment Guidance. Office of Superfund Programs, Region III, Philadelphia, PA.

CAS No. = Chemical Abstract Service No.
ABS_d = Dermal Absorption Factor
VF = Volatilization Factor
D_A = Apparent Diffusivity
m^3/kg = cubic meters per kilogram
cm^2/s = centimeter squared per second

[a] ABS_d values are taken from Exhibit 3-4, Risk Assessment Guidance for Superfund (RAGS), Volume 1, Human Health Evaluation and Manual, Part E; Supplemental Guidance for Dermal Risk Assessment, July 2004, and Region III Technical Guidance, Assessing Dermal Exposure in Soil, December 1995, unless otherwise noted.

[b] Values for derivation of VF are taken from the USEPA Regional Screening Levels Table, Physical-Chemical Parameters (dated September 12, 2008).

[c] Calculated value: $K_d = K_{oc} \times f_{oc}$

Table E.1-15
PEF Calculation - Construction Worker
Radford Army Ammunition Plant - SWMU 50

Site Name: **Radford SWMU 50**

Calculation of Site-Specific Construction Worker PEF:

$$PEF_{sc} = Q / C_{sr} \; x \; \frac{1}{F_D} \; x \left[\frac{T \; x \; A_R}{556 \; x \; (W/3)^{0.4} \; x \; \frac{365 \; day/yr - p)}{365 \; day/yr} \; x \; \sum VKT} \right]$$

Variable	Value	Units	Description
Q/C_{sr} =	**18.36**	g/m^2-s per kg/m^3	**calculated below**
Duration of construction =	**6**	months	
	25	weeks	
	125	days	assuming 5 days per week
t_c =	1,000	hours	assuming 8 hour days
	60,000	min	
T =	3,600,000	sec	
F_D =	0.185		dispersion correction factor
Surface area of site =	**2.061**	acres	**Site-specific**
Surface area of site =	8,340.9	m^2	
Length of side of area configured as a square =	91.3	m	equal to the square root of the area of the site
L_R =	300	ft	side of area configured as a square
W_R =	20	ft	width of roadway segment - default
A_R =	557.4	m^2	surface area of contaminated roadway segment
W =	**6**	tons	mean vehicle weight - default, assuming 2, 2-ton cars and 2, 10-ton trucks
p =	**119**	days/yr	Number of days/yr with at least 0.01 inches of precipitation - value for Radford Area from Exhibit 5-1
Number of vehicles on site	**2**	cars	value based on assumptions for W
	2	truck	
VKT =	22.8	km	sum of vehicle km traveled during exposure duration - assuming each vehicles travels road once per day and 5 days/week for total time

Variables in **BOLD** are site-specific and should be entered for each site

PEF_{sc} = 1.76E+07 m^3/kg

$$Q / C_{sr} = A \; x \; \exp \left[\frac{(\ln A_s - B)^2}{C} \right]$$

Variable	Value	Units	Description
A_s =	**2.061**	acres	Site specific area
A =	12.9351		default constant
B =	5.7383		default constant
C =	71.7711		default constant

Q/C_{sr} = 18.36 g/m^2-s per kg/m^3

A_s is site-specific and a value should be entered for each site

Table E.1-16
PEF Calculation - Commercial/Industrial Worker
Radford Army Ammunition Plant - SWMU 50

Site name: Radford SWMU 50

Calculation of Site-Specific Commercial/Industrial Worker PEF:
This value can be applied to workers as well as residents unless site area is greater than 0.5 acres.
Equation 4-5 from USEPA, 2002

$$PEF = \frac{Q}{C_{wind}} \; x \; \frac{3{,}600 \text{ sec/hr}}{0.036 \; x \; (1-V) \; x \; (U_m/U_t)^3 \; x \; F(x)}$$

Variable	Value	Units	Description
Q/C_{wind} =	45.34	g/m^2-s per kg/m^3	Calculated below
V =	**0.5**	unitless	fraction of vegetative cover
U_m =	**3.5**	m/s	mean annual windspeed
U_t =	**11.32**	m/s	equivalent threshold value of windspeed at 7 m
F(x) =	**0.194**	unitless	function dependent on U_m/U_t derived using Cowherd et al., 1985

Q/C_{wind} can be used for any source size from 0.5 acres to 500 acres using the equation and look up tables in Appendix D, Exhibit D-2. Source of 0.5 acres is the size of a typical exposure unit.

PEF = 1.58E+09 m^3/kg

From Exhibit D-2 from USEPA 2002:

$$Q/C_{wind} = A \; x \; \exp\left[\frac{(\ln A_s - B)^2}{C}\right]$$

Variable	Value	Units	Description
A =	9.9253		Site-specific value
B =	18.6636		Site-specific value
C =	211.8862		Site-specific value
A_s =	**2.061**	acres	**Contaminated site area**

Q/C_{wind} = 45.34 g/m^2-s/kg/m^3

Table E.1-17
PEF Calculation - Residents
Radford Army Ammunition Plant - SWMU 50

Site name: Radford SWMU 50

Calculation of Site-Specific Residential PEF:
A separate PEF for residents must be calculated if the site in question is greater than 0.5 acres in size. This residential PEF is based on a 0.5 acre residential site.
Equation 4-5 from USEPA, 2002

$$PEF = \frac{Q}{C_{wind}} \; x \; \frac{3{,}600 \; sec/hr}{0.036 \; x \; (1-V) \; x \; (U_m/U_t)^3 \; x \; F(x)}$$

Variable	Value	Units	Description
Q/C_{wind} =	58.17	g/m^2-s per kg/m^3	Calculated below
V =	**0.5**	unitless	fraction of vegetative cover
U_m =	**3.5**	m/s	mean annual windspeed
U_t =	**11.32**	m/s	equivalent threshold value of windspeed at 7 m
F(x) =	**0.194**	unitless	function dependent on U_m/U_t derived using Cowherd et al., 1985

Q/C_{wind} can be used for any source size from 0.5 acres to 500 acres using the equation and look up tables in Appendix D, Exhibit D-2. Source of 0.5 acres is the size of a typical exposure unit.

PEF_R = 2.03E+09 m^3/kg

From Exhibit D-2 from USEPA 2002:

$$Q/C_{wind} = A \; x \; \exp\left[\frac{(\ln A_s - B)^2}{C}\right]$$

Variable	Value	Units	Description
A =	9.9253		Site-specific value
B =	18.6636		Site-specific value
C =	211.8862		Site-specific value
A_s =	0.5	acres	**Residential exposure**

Q/C_{wind} = 58.17 g/m^2-s/kg/m^3

Table E.1-18
VF Calculation - Construction Worker
Radford Army Ammunition Plant - SWMU 50

Site Name: Radford SWMU 50

D_A values calculated using the following equation and values from the Supplemental Guidance for Developing Soil Screening Levels at Superfund Sites. OSWER 9355.4-24. USEPA, 2002.

Equation 4-8 from USEPA, 2002.

This equation is chemical-specific.

$$D_A = \frac{[((\theta_a^{10/3} x D_i x H) + (\theta_w^{10/3} x D_w))/n^2]}{((\rho_b x K_d) + \theta_w + (\theta_a x H))}$$

Chemical name: **Chloroform**

Variable	Value	Units	Description
θ_a =	0.28	L_{air}/L_{soil}	default
θ_w =	0.15	L_{water}/L_{soil}	default
D_i =	**7.70E-02**	cm^2/s	**chemical-specific from VF table**
D_w =	**1.10E-05**	cm^2/s	**chemical-specific from VF table**
H =	**1.50E-01**	unitless	**chemical-specific from VF table**
n =	0.43	L_{pore}/L_{soil}	default
ρ_b =	1.5	g/cm^3	default
K_d =	**0.21**	cm^3/g	**chemical-specific from VF table**
K_{oc} =	**35.0**	cm^3/g	**chemical-specific from VF table**
f_{oc} =	0.006	g/g	

D_A = 1.8E-03 cm^2/s

This equation is chemical-specific. Bold variables - information is required for each chemical
Copy this worksheet for each volatile COPC to calculate VF.

VF (soil only) values for construction worker were calculated using the following equations from the Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites. OSWER 9355.4-24. USEPA, 2002. Equation 5-14 from USEPA, 2002

$$VF_{sc} = \frac{(3.14 x D_A x T)^{1/2} x CF}{2 x \rho_b x D_A} \; x \; \frac{Q}{C_{sa}} \; x \; \frac{1}{F_D}$$

Variable	Value	Units	Description
Q/C_{sa} =	11.00	g/m^2-s/kg/m^3	calculated below
F_D =	0.185	unitless	default
D_A =	1.8E-03	cm^2/s	**chemical specific - calculated above**
T =	**3,600,000**	**seconds**	Receptor-specific exposure interval (example: T= 1 yr*125 days/yr*8 hr/day*60 min/hr*60 sec/min)
CF =	1.00E-04	m^2/cm^2	default conversion factor
ρ_b =	1.5	g/cm^3	default

VF_{sc} = 1.6E+02 m^3/kg

Equation 5-15 from USEPA, 2002:

$$Q/C_{sa} = A \; x \exp\left[\frac{(\ln A_c - B)^2}{C}\right]$$

Variable	Value	Units	Description
A =	2.4538		default constant
B =	17.566		default constant
C =	189.0426		default constant
A_c =	**2.061**	acres	**site-specific**

A_c is site specific - area should change for each site

Q/C_{sa} = 11.00 g/m^2-s/kg/m^3

Table E.1-19
VF Calculation - Maintenance Worker
Radford Army Ammunition Plant - SWMU 50

(1) For IRIS values, the date IRIS was searched and the date of the most recent review are provided.
For HEAST values, the date of HEAST is provided.
(2) The IUR Is based on a 1:6 ratio of Chromium VI to Chromium III.

EPA Group:
A - Human carcinogen
B1 - Probable human carcinogen - indicates that limited human data are available
B2 - Probable human carcinogen - indicates sufficient evidence in animals and inadequate or no evidence in humans
C - Possible human carcinogen
D - Not classifiable as a human carcinogen
E - Evidence of noncarcinogenicity

			Exp. Route Total								3.9E-08
		Exposure Point Total									3.9E-08
	Exposure Media Total										3.9E-08
	Air (Volatiles)	SWMU 50	**Inhalation**	**Organics** No COPCs							
			Exp. Route Total								0.0E+00
		Exposure Point Total									0.0E+00
	Exposure Media Total										0.0E+00
Surface Soil Total											6.4E-06
										Total of Receptor Risks Across All Media	6.4E-06

N/A = Not Applicable.

Since surface soil represents the more highly contaminated portion of soil, total risk and hazard estimates are conservatively based on this data grouping.

			Exp. Route Total								2.1E-02
		Exposure Point Total									2.1E-02
	Exposure Media Total										2.1E-02
	Air (Volatiles)	SWMU 50	**Inhalation**	**Organics** No COPCs							
			Exp. Route Total								0.0E+00
		Exposure Point Total									0.0E+00
	Exposure Media Total										0.0E+00
Surface Soil Total											3.2E-01
										Total of Receptor Hazards Across All Media	2.9E-01

N/A = Not Applicable.

Since total soil represents the more highly contaminated portion of soil, total risk and hazard estimates are conservatively based on this data grouping.

Table E.1-45
Risk Assessment Summary
Reasonable Maximum Exposure
Current - Maintenance Worker

Scenario Timeframe: Current
Receptor Population: Maintenance Worker
Receptor Age: Adult

Medium	Exposure Medium	Exposure Point	Chemical of Potential Concern	Carcinogenic Risk				Non-Carcinogenic Hazard Quotient				
				Ingestion	Inhalation	Dermal	Exposure Routes Total	Primary Target Organ	Ingestion	Inhalation	Dermal	Exposure Routes Total
Surface Soil	Surface Soil	SWMU 50										
			Chemical Total				1.4E-06 (a)					<1
		Exposure Point Total					1.4E-06 (a)					<1
	Exposure Media Total						1.4E-06 (a)					<1
	Air (Particulates and Volatiles)	SWMU 50										
			Chemical Total				<1.0E-06					<1
		Exposure Point Total					<1.0E-06					<1
	Exposure Media Total						<1.0E-06					<1
Surface Soil Total							1.4E-06 (a)					<1
Receptor Total							1.4E-06 (a)					<1

Total Risk Across All Media = 1.4E-06 (a)

Total Hazard Across All Media = <1

(a) Although no individual chemical or media type exposure exceeds 1.0E-06, the total risk is equal to 1.4E-06.

Table E.1-46
Risk Assessment Summary
Reasonable Maximum Exposure
Future - Maintenance Worker

Scenario Timeframe: Future
Receptor Population: Maintenance Worker
Receptor Age: Adult

Medium	Exposure Medium	Exposure Point	Chemical of Potential Concern	Carcinogenic Risk				Non-Carcinogenic Hazard Quotient				
				Ingestion	Inhalation	Dermal	Exposure Routes Total	Primary Target Organ	Ingestion	Inhalation	Dermal	Exposure Routes Total
Total Soil	Total Soil	SWMU 50										
			Chemical Total				1.2E-06 (a)					<1
		Exposure Point Total					1.2E-06 (a)					<1
	Exposure Media Total						1.2E-06 (a)					<1
	Air (Particulates and Volatiles)	SWMU 50										
			Chemical Total				<1.0E-06					<1
		Exposure Point Total					<1.0E-06					<1
	Exposure Media Total						<1.0E-06					<1
Total Soil Total							1.2E-06 (a)					<1
Surface Soil	Surface Soil	SWMU 50										
			Chemical Total				1.4E-06 (a)					<1
		Exposure Point Total					1.4E-06 (a)					<1
	Exposure Media Total						1.4E-06 (a)					<1
	Air (Particulates and Volatiles)	SWMU 50										
			Chemical Total				<1.0E-06					<1
		Exposure Point Total					<1.0E-06					<1
	Exposure Media Total						<1.0E-06					<1
Surface Soil Total							1.4E-06 (a)					<1
Receptor Total[a]							1.4E-06 (a)					<1

Total Risk Across All Media[b] = 1.4E-06 (a)

Total Hazard Across All Media = <1

(a) Although no individual chemical or media type exposure exceeds 1.0E-06, the total risk is greater than 1.0E-06.
(b) Since total soil represents the more highly contaminated portion of soil, total risk estimates are conservatively based on this soil data grouping.

Table E.1-47
Risk Assessment Summary
Reasonable Maximum Exposure
Future - Industrial Worker

Scenario Timeframe: Future
Receptor Population: Industrial Worker
Receptor Age: Adult

	Num Obs	Num Miss	Num Valid	Detects	NDs	% NDs
Raw Statistics	28	14	14	0	14	100.00%

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Antimony (mg/kg) (rfaap bkgrd-ss) was not processed!

From File	H:\Risk DB\Radford\SWMUs 50-59\Background Stats\50_ProUCL_input_SS_for BKG.wst
Full Precision	OFF
Confidence Coefficient	95%
Substantial Difference	0
Selected Null Hypothesis	Site or AOC Mean/Median Less Than or Equal to Background Mean/Median (Form 1)
Alternative Hypothesis	Site or AOC Mean/Median Greater Than Background Mean/Median

Area of Concern Data: Sodium (mg/kg)(swmu 50 ss)
Background Data: Sodium (mg/kg)(rfaap bkgrd-ss)

Raw Statistics

	Site	Background
Number of Valid Data	14	28
Number of Missing Values	1	0
Number of Non-Detect Data	11	27
Number of Detect Data	3	1
Minimum Non-Detect	4.2	10.8
Maximum Non-Detect	48	25.9
Percent Non detects	78.57%	96.43%
Minimum Detected	61.7	124
Maximum Detected	72.5	124
Mean of Detected Data	66.37	124
Median of Detected Data	64.9	124
SD of Detected Data	5.547	N/A

Site vs Background Gehan Test

H0: Mean/Median of Site or AOC <= Mean/Median of background

Gehan z Test Value	1.755
Critical z (0.95)	1.645
P-Value	0.0396

Conclusion with Alpha = 0.05
Reject H0, Conclude Site > Background
P-Value < alpha (0.05)

Appendix E.7A

Full Precision	OFF
Confidence Coefficient	95%
Substantial Difference	0
Selected Null Hypothesis	Site or AOC Mean/Median Less Than or Equal to Background Mean/Median (Form 1)
Alternative Hypothesis	Site or AOC Mean/Median Greater Than Background Mean/Median

Area of Concern Data: Thallium (mg/kg)(swmu 50 ss)
Background Data: Thallium (mg/kg)(rfaap bkgrd-ss)

Raw Statistics

	Site	Background
Number of Valid Data	10	28
Number of Missing Values	5	0
Number of Non-Detect Data	10	24
Number of Detect Data	0	4
Minimum Non-Detect	2.4	0.13
Maximum Non-Detect	13	0.41
Percent Non detects	100.00%	85.71%
Minimum Detected	N/A	1.3
Maximum Detected	N/A	2.1
Mean of Detected Data	N/A	1.85
Median of Detected Data	N/A	2
SD of Detected Data	N/A	0.37

Site vs Background Gehan Test

H0: Mean/Median of Site or AOC <= Mean/Median of background

Gehan z Test Value	0
Critical z (0.95)	1.645
P-Value	0.5

Conclusion with Alpha = 0.05
Do Not Reject H0, Conclude Site <= Background
P-Value >= alpha (0.05)

Appendix E.7A

Antimony (mg/kg) (rfaap bkgrd ts)

	Num Obs	Num Miss	Num Valid	Detects	NDs	% NDs
Raw Statistics	79	41	38	0	38	100.00%

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Antimony (mg/kg) (rfaap bkgrd ts) was not processed!

Thallium (mg/kg) (swmu 50 ts)

	Num Obs	Num Miss	Num Valid	Detects	NDs	% NDs
Raw Statistics	31	10	21	0	21	100.00%

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Thallium (mg/kg) (swmu 50 ts) was not processed!

Antimony (mg/kg) (rfaap bkgrd-ss)

	Num Obs	Num Miss	Num Valid	Detects	NDs	% NDs
Raw Statistics	28	14	14	0	14	100.00%

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Antimony (mg/kg) (rfaap bkgrd-ss) was not processed!

Antimony (mg/kg) (rfaap swmu 59 ss)

	Num Obs	Num Miss	Num Valid	Detects	NDs	% NDs
Raw Statistics	16	0	16	1	15	93.75%

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Antimony (mg/kg) (rfaap swmu 59 ss) was not processed!

Cadmium (mg/kg) (swmu 59 ts)

	Num Obs	Num Miss	Num Valid	Detects	NDs	% NDs
Raw Statistics	28	0	28	2	26	92.86%

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!

It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Cadmium (mg/kg) (swmu 59 ts) was not processed!

American robin *(Turdus migratorius)*	0.0635-0.103 (0.0773)	0.48 [1.2]	0.020	0.016	(4%) 0.00064-0.00080	0.013	0.011	Omnivore	Plants: 62% Terr Inverts: 38%
Red-tailed hawk (*Buteo jamaicensis*)	0.957-1.235 (1.134)	842 [2081]	0.063	0.059	(0%)	0.068	0.064	Carnivore	Mammals: 76% Birds: 24%
Red fox *(Vulpes vulpes)*	2.95-7.04 (4.53)	892 [2204]	0.34	0.24	(2.8%) 0.0067-0.0095	0.57	0.39	Carnivore	Mammals: 65% Birds: 14% Plants: 17% Terr. Inverts: 4%

[a] From USEPA (1993), except as noted.
[b] Maximum dietary and water intake based on appropriate allometric equation using maximum body weight.
[c] Average dietary and water intake based on appropriate allometric equation using average body weight.
[d] Soil/sediment ingestion rate based on estimated percent soil in diet (dry weight), and maximum or average dietary intake.

Allometric equations for mammals and birds from USEPA (1993), as follows, where FI = food ingestion (dry weight [dw]), WI = water ingestion, Wt = body weight, kg = kilogram, L = liter, and g = gram:
FI (kg/day) = 0.0687 $Wt^{0.822}$ for mammals (shrew and red fox),
FI (g/day) = 0.577 $Wt^{0.727}$ for herbivores (meadow vole),
FI (g/day) = 0.301 $Wt^{0.751}$ for non-passerine birds (red-tail hawk),
FI (g/day) = 0.398 $Wt^{0.850}$ for passerine birds (American robin).
WI (L/day) = 0.099 $Wt^{0.90}$ (Wt in kg) for mammals,
WI (L/day) = 0.059 $Wt^{0.67}$ (Wt in kg) for birds.

ha = hectare
ac = acre, and a hectare = 2.471 acres.

Notes:
The soil ingestion rate for the shrew set equal to the rate for the American woodcock (10.4% of diet), as both species feed predominantly on earthworms.
The soil ingestion rate for the American robin set equal to 48% of the American woodcock value (0.38 x 10.4% = 4%), based on a robin diet of 38% invertebrates (earthworms).

Hazard Index (Total EEQ): 9.3E+01 4.3E+01

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	1	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	0	unitless
Mammal diet fraction =	0	unitless
Bird diet fraction =	0	unitless
Soil ingestion rate =	0.00024	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.01	kg/d
Body weight =	0.017	kg
Home range =	0.089	acres
Water intake rate =	0.007	L/d
Site Area =	2.06	acres
Frac. home range (FHR) =	1.00E+00	unitless

Hazard Index (Total EEQ): 2.5E+01 1.2E+01

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used as default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	1	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	0	unitless
Mammal diet fraction =	0	unitless
Bird diet fraction =	0	unitless
Soil ingestion rate =	0.00019	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.008	kg/d
Body weight =	0.037	kg
Home range =	0.089	acres
Water intake rate =	0.0051	L/d
Site Area =	2.06	acres
Frac. home range (FHR) =	1.00E+00	unitless

																						Hazard Index (Total EEQ):			9.4E+03			1.1E+03

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	0	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	1	unitless
Mammal diet fraction =	0	unitless
Bird diet fraction =	0	unitless
Soil ingestion rate =	0.00031	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.003	kg/d
Body weight =	0.0125	kg
Home range =	0.96	acres
Water intake rate =	0.0033	L/d
Site Area =	2.06	acres
Frac. home range (FHR) =	1.00E+00	unitless

Hazard Index (Total EEQ): 5.5E+02 7.2E+01

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used as default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	0	unitless

Bird diet fraction =	0	unitless
Soil ingestion rate =	0.00023	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.0022	kg/d
Body weight =	0.015	kg
Home range =	0.96	acres
Water intake rate =	0.0023	L/d
Site Area =	2.06	acres
Frac. home range (FHR) =	1.00E+00	unitless

TABLE F-6
TIER 1 CHEMICALS OF POTENTIAL CONCERN EEQs AND HAZARD INDICES FOR AMERICAN ROBINS AT SWMU 50

Hazard Estimate - Tier 1
American Robin

Chemical	Surface Water Exposure Point Concentration	Units	Sediment Exposure Point Concentration	Units	Soil Exposure Point Concentration	Units	Fish BAF	Aq. Invert. BAF	Terr. Invert. Hazard Index (Total EEQ): 1.1E+03 1.6E+02

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	0.62	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	0.38	unitless
Mammal diet fraction =	0	unitless
Bird diet fraction =	0	unitless
Soil ingestion rate =	0.0008	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.02	kg/d
Body weight =	0.0635	kg
Home range =	1.2	acres
Water intake rate =	0.013	L/d
Site Area =	2.06	acres
Frac. home range (FHR) =	1.00E+00	unitless

TABLE F-7
TIER 2 CHEMICALS OF POTENTIAL ECOLOGICAL CONCERN EEQs AND HAZARD INDICES FOR AMERICAN ROBINS AT SWMU 50

Hazard Estimate - Tier 2

Hazard Index (Total EEQ): 1.2E+02 2.3E+01

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used as default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	0.62	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	0.38	unitless
Mammal diet fraction =	0	unitless
Bird diet fraction =	0	unitless
Soil ingestion rate =	0.00064	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.016	kg/d
Body weight =	0.0773	kg
Home range =	1.2	acres
Water intake rate =	0.011	L/d
Site Area =	2.06	acres
Frac. home range (FHR) =	1.00E+00	unitless

Hazard Index (Total EEQ): 3.4E+01 6.0E+00

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	0	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	0	unitless
Mammal diet fraction =	0.76	unitless
Bird diet fraction =	0.24	unitless
Soil ingestion rate =	0	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.063	kg/d
Body weight =	0.957	kg
Home range =	2081	acres
Water intake rate =	0.068	L/d
Site Area =	2.06	acres
Frac. home range (FHR) =	1.00E+00	unitless

Hazard Index (Total EEQ): 1.8E-02 3.0E-03

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used as default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	0	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	0	unitless
Mammal diet fraction =	0.76	unitless
Bird diet fraction =	0.24	unitless
Soil ingestion rate =	0	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.059	kg/d
Body weight =	1.134	kg
Home range =	2081	acres
Water intake rate =	0.064	L/d
Site Area =	2.06	acres
Frac. home range (FHR) =	9.90E-04	unitless

																						Hazard Index (Total EEQ):			3.7E+02			4.7E+01

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	0.17	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	0.04	unitless
Mammal diet fraction =	0.65	unitless
Bird diet fraction =	0.14	unitless
Soil ingestion rate =	0.0095	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.34	kg/d
Body weight =	2.95	kg
Home range =	2204	acres
Water intake rate =	0.57	L/d
Site Area =	2.06	acres
Frac. home range (FHR) =	1.00E+00	unitless

Hazard Index (Total EEQ): 6.0E-02 8.5E-03

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used as default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	0.17	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	0.04	unitless
Mammal diet fraction =	0.65	unitless
Bird diet fraction =	0.14	unitless
Soil ingestion rate =	0.0067	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.24	kg/d
Body weight =	4.53	kg
Home range =	2204	acres
Water intake rate =	0.39	L/d
Site Area =	2.06	acres
Frac. home range (FHR) =	9.35E-04	unitless

Hazard Index (Total EEQ): 1.0E+02 4.0E+01

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	1	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	0	unitless
Mammal diet fraction =	0	unitless
Bird diet fraction =	0	unitless
Soil ingestion rate =	0.00024	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.01	kg/d
Body weight =	0.017	kg
Home range =	0.089	acres
Water intake rate =	0.007	L/d
Site Area =	0.57	acres
Frac. home range (FHR) =	1.00E+00	unitless

																					Hazard Index (Total EEQ):			3.0E+01			1.3E+01

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used as default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	1	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	0	unitless
Mammal diet fraction =	0	unitless
Bird diet fraction =	0	unitless
Soil ingestion rate =	0.00019	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.008	kg/d
Body weight =	0.037	kg
Home range =	0.089	acres
Water intake rate =	0.0051	L/d
Site Area =	0.57	acres
Frac. home range (FHR) =	1.00E+00	unitless

TABLE F-14
TIER 1 CHEMICALS OF POTENTIAL CONCERN EEQs AND HAZARD INDICES FOR SHORT-TAILED SHREWS AT SWMU 59

Hazard Estimate - Tier 1

																						Hazard Index (Total EEQ):			1.3E+03			1.7E+02

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	0	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	1	unitless
Mammal diet fraction =	0	unitless
Bird diet fraction =	0	unitless
Soil ingestion rate =	0.00031	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.003	kg/d
Body weight =	0.0125	kg
Home range =	0.96	acres
Water intake rate =	0.0033	L/d
Site Area =	0.57	acres
Frac. home range (FHR) =	1.00E+00	unitless

Hazard Index (Total EEQ): 7.4E+01 1.8E+01

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used as default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	0	unitless

Soil ingestion rate =	0.00023	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.0022	kg/d
Body weight =	0.015	kg
Home range =	0.96	acres
Water intake rate =	0.0023	L/d
Site Area =	0.57	acres
Frac. home range (FHR) =	5.94E-01	unitless

TABLE F-16
TIER 1 CHEMICALS OF POTENTIAL CONCERN EEQs AND HAZARD INDICES FOR AMERICAN ROBINS AT SWMU 59

Hazard Estimate - Tier 1
American Robin

Chemical	Surface Water Exposure Point Concentration	Units	Sediment Exposure Point Concentration	Units	Soil Exposure Point Concentration	Units	Fish BAF	Aq. Invert. BAF	Terr. Invert. Hazard Index (Total EEQ): 2.0E+02 5.2E+01

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	0.62	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	0.38	unitless
Mammal diet fraction =	0	unitless
Bird diet fraction =	0	unitless
Soil ingestion rate =	0.0008	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.02	kg/d
Body weight =	0.0635	kg
Home range =	1.2	acres
Water intake rate =	0.013	L/d
Site Area =	0.57	acres
Frac. home range (FHR) =	1.00E+00	unitless

TABLE F-17
TIER 2 CHEMICALS OF POTENTIAL ECOLOGICAL CONCERN EEQs AND HAZARD INDICES FOR AMERICAN ROBINS AT SWMU 59

Hazard Estimate - Tier 2

																					Hazard Index (Total EEQ):			3.0E+01			7.4E+00

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used as default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	0.62	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	0.38	unitless
Mammal diet fraction =	0	unitless
Bird diet fraction =	0	unitless
Soil ingestion rate =	0.00064	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.016	kg/d
Body weight =	0.0773	kg
Home range =	1.2	acres
Water intake rate =	0.011	L/d
Site Area =	0.57	acres
Frac. home range (FHR) =	4.75E-01	unitless

TABLE F-18
TIER 1 CHEMICALS OF POTENTIAL CONCERN EEQs AND HAZARD INDICES FOR RED-TAILED HAWKS AT SWMU 59

Hazard Estimate - Tier 1

Hazard Index (Total EEQ): 1.1E+01 2.9E+00

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	0	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	0	unitless
Mammal diet fraction =	0.76	unitless
Bird diet fraction =	0.24	unitless
Soil ingestion rate =	0	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.063	kg/d
Body weight =	0.957	kg
Home range =	2081	acres
Water intake rate =	0.068	L/d
Site Area =	0.57	acres
Frac. home range (FHR) =	1.00E+00	unitless

Hazard Index (Total EEQ): 1.9E-03 5.0E-04

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used as default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	0	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	0	unitless
Mammal diet fraction =	0.76	unitless
Bird diet fraction =	0.24	unitless
Soil ingestion rate =	0	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.059	kg/d
Body weight =	1.134	kg
Home range =	2081	acres
Water intake rate =	0.064	L/d
Site Area =	0.57	acres
Frac. home range (FHR) =	2.74E-04	unitless

Hazard Index (Total EEQ): 6.9E+01 1.5E+01

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	0.17	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	0.04	unitless
Mammal diet fraction =	0.65	unitless
Bird diet fraction =	0.14	unitless
Soil ingestion rate =	0.0095	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.34	kg/d
Body weight =	2.95	kg
Home range =	2204	acres
Water intake rate =	0.57	L/d
Site Area =	0.57	acres
Frac. home range (FHR) =	1.00E+00	unitless

TABLE F-21
TIER 2 CHEMICALS OF POTENTIAL CONCERN EEQs AND HAZARD INDICES FOR RED FOXES AT SWMU 59

Hazard Estimate - Tier 2
Red Fox

																					Hazard Index (Total EEQ):				4.5E-03			1.3E-03

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used as default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Species-Specific Factors

Plant diet fraction =	0.17	unitless
Fish diet fraction =	0	unitless
Aq. Invert diet fraction =	0	unitless
Terr. Invert diet fraction =	0.04	unitless
Mammal diet fraction =	0.65	unitless
Bird diet fraction =	0.14	unitless
Soil ingestion rate =	0.0067	kg/d
Sediment ingestion rate =	0	kg/d
Food ingestion rate =	0.24	kg/d
Body weight =	4.53	kg
Home range =	2204	acres
Water intake rate =	0.39	L/d
Site Area =	0.57	acres
Frac. home range (FHR) =	2.59E-04	unitless

Notes:

Tier 1 = Max EEQ using max EPC, max BAF/BCF, max Intake Rates, min BW, and FHR =1.
Tier 2 = EEQ using 95% EPC, non-max BAF/BCF, avg Intake Rates, avg BW and calculated FHR.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
PDE = Predicted Daily Exposure
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box):
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used as default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Notes: EW (earthworm tissue concentration [mg/kg d.w.]); soil (concentration in soil [mg/kg d.w.]); BAF/BCF (bioaccumulation/bioconcentration factor); log Kow (octanol/water partition coefficient); -- indicates that a BAF/BCF or regression equation is not available or not applicable.
Hierarchy for Selection of BAFs:

[a] USEPA, 2007, Ecological Soil Screening Level Guidance (Eco-SSL), Soil to Earthworm Uptake Equations, OSWER Directive 9285.7-55.

Table F-24
Recommended Bioaccumulation/Bioconcentration Factors or Regression Equations Utilized for the Soil-to-Earthworm Pathway at SWMUs 50 and 59

Constituent	USEPA (2007) Eco-SSL Uptake Equation [a]	Sample, et al. 1998 [b]			Sample et al. 1999 [c]	Recommended Tier 1	Rationale for Recommended Tier 1 BAF/BCF	Recommended Tier 2	Rationale for Recommended Tier 2 BAF/BCF
		Median BAF/BCF	90th Percentile BAF/BCF	Maximum BAF/BCF	Regression Equation	BAF/BCF		BAF/BCF	

[b] Sample, B. E, et. al., 1998. Development and Validation of Bioaccumulation Models for Earthworms, ES/ER/TM-220.

[c] Sample, B.E, et. al., 1999, Literature-Derived Bioaccumulation Models for Earthworms: Development and Validation, Environ. Toxicol. Chem., 18(9): 2110-2120 (models from Table 3 of publication).

[e] USEPA, 2007, EcoSSL regression equation using site specific TOC values and chemical specific log Kow and Koc values. Equation details provided below.

Log Kow values and Koc values are from: USEPA, 2007, Estimation Programs Interface (EPI) Suite, v3.20.

TOC values collected at SWMU 50 snd 59 were utilized as follows: Tier 1: Lower-bound (geometric mean of samples) surface soil TOC **1.63%**; Tier 2 arithmetic mean (mean of samples) surface soil TOC =**1.65%**.

TOC values:	Sample ID	Area / Matrix	Analyte	Result	Units
	50SS01	SWMU 50 / SS	Total Organic Carbon	18900	mg/kg
	59SS03	SWMU 59 / SS	Total Organic Carbon	14000	mg/kg
			(Tier 1) TOC Geo. Mean =	**16267**	**mg/kg**
			(Tier 2) TOC Arithmetic Mean =	**16450**	**mg/kg**

Equation:

$$BAF = \frac{((10^{(0.87*\log Kow-2)})/0.16)}{foc* Koc}$$

Log Kow, Koc, BAF Results:	Constituent	Koc	Log Kow	Tier 1 BAF/BCF	Tier 2 BAF/BCF

Notes: mam (mammal or bird tissue concentration [mg/kg d.w.]); diet (concentration in diet [mg/kg d.w.] assuming 100% earthworm consumption); soil (concentration in soil [mg/kg d.w.]); BAF/BCF (bioaccumulation/bioconcentration factor).

Bird BAF/BCF values were based on the recommended small mammal BAF/BCF values, as bird uptake values are not readily available.

[a] USEPA, 2007, Ecological Soil Screening Level Guidance, Soil to Small Mammal Uptake Equations, OSWER Directive 9285.7-55.

[b] Sample et al., 1998, Development and Validation of Bioaccumulation Models for Small Mammals, ES/ER/TM-219.

[c] General = combination dataset used for insectivore, herbivore, and omnivore receptors to estimate a "general" receptor BAF/BCF value.

[d] "--" indicates that a BAF/BCF is not available or not applicable.

Table F-25
Recommended Bioaccumulation/Bioconcentration Factors Utilized for the Soil-to-Small Mammal and Bird Pathways at SWMUs 50 and 59

Constituent	USEPA (2007) Eco-SSL Uptake Equation [a]	Sample et al., 1998 [b]						Recommended Tier 1 BAF/BCF	Rationale for Recommended Tier 1 BAF/BCF	Recommended Tier 2 BAF/BCF	Rationale for Recommended Tier 2 BAF/BCF
		Insectivore Median BAF/BCF	Herbivore Median BAF/BCF	Omnivore Median BAF/BCF	General [c] Median BAF/BCF	General [c] Maximum BAF/BCF	General [c] 90th percentile BAF/BCF				

[e] Uptake assumed to be negligible (USEPA 2005).

[f] Known bioaccumulative organics (TCDD and TCDF) have BAFs/BCFs of 1.1 and 0.13 (median) and 2.2 and 0.16 (maximum) from Sample et al. (1998).
Conservative BAF/BCF default values of 1 and 0.5 were selected for other organics at the site, as they are not expected to be as bioaccumulative as TCDD/TCDF.

[g] Only one BAF/BCF value available for exposure to mercury in soil (median is also 90th percentile value and maximum value).

N/A indicates that the information is not available.

As recommended by Wentsel, et. al. (1996), Tri-Service Procedural Guidelines for Ecological Risk Assessments, the following adjustments were made to toxicity data when NOAEL or LOAEL data were not available:

- Subchronic LOAELs were converted to chronic NOAELs by dividing by a factor of 20.
- Chronic NOAELs were converted to chronic LOAELs by multiplying by a factor of 5.0.
- Subchronic NOAELs/LOAELs were converted to chronic NOAELs/LOAELs by dividing by a factor of 10.
- Chronic LOAELs were converted to chronic NOAELs by dividing by a factor of 10.
- LD_{50} concentrations were converted to chronic NOAELs by dividing by a factor of 100.
- LD_{50} concentrations were converted to chronic LOAELs by dividing by a factor of 20.

Methodology for Selection of TRVs:

(1) Sample, et al., 1996, Toxicological Benchmarks for Wildlife.

(2) USEPA, 2007, Ecological Screening Levels (Eco-SSL). Low molecular weigh (LMW) PAH NOAELs based on Verschuuren et al., 1976; high molecular weight (HMW) PAH NOAELs based on Culp, et al., 1998; LMW LOAELs based on Murata et al., 1997; HMW PAH LOAELs based on Culp, et al., 1998.

(3) LANL (2005). Ecorisk Database, Release 2.2, September 2005, Los Alamos National Laboratory.

(4) Others as listed below:

ATSDR, 1990, Toxicological Profile for Silver, U.S. Public Health Service.
ATSDR, 1996, Toxicological Profile for 1,1,2,2-Tetrachloroethane, U.S. Public Health Service.
Eisler, 1987, PAH Hazards to Fish, Wildlife, and Invertebrates: A Synoptic Review.
TERRETOX, http://www.epa.gov/ecotox.
USACHPPM, 2002, Terrestrial Toxicity Database.
USEPA, 1999, SLERA Protocol for Hazardous Waste Combustion Facilties.
USEPA, 2000, OPP (Office of Pesticide Programs). Environmental Effects Database (EEDB).
USEPA, 2008, Integrated Risk Information System (IRIS).

Fluorene	--	1.10E+02	mouse	EcoSSL (EPA, 2007)	553 (NOAEL)	2.77E+03	mallard duck	Based on Benzo(a)pyrene, Eisler 1987
gamma-Chlordane	--	9.20E+00	mouse	Based on Chlordane, Sample, et. al. (1996)	--	1.07E+01	red-winged blackbird	Based on Chlordane, Sample, et. al. (1996)
Heptachlor epoxide	--	1.00E+00	mink	Based on Heptachlor, Sample, et. al. (1996)	92 (LC50)	4.60E+00	quail	Based on Heptachlor, LANL (2005)
Indeno(1,2,3-cd)pyrene	--	3.07E+00	mouse	EcoSSL (EPA, 2007)	553 (NOAEL)	2.77E+03	mallard duck	Based on B(a)P, Eisler (1987)

Table F-27
LOAEL Toxicity Reference Values Used to Derive
Wildlife Toxicity Benchmarks for COPECs at SWMUs 50 and 59

COPEC	Mammalian Data				Avian Data			
	Toxicity Value	LOAEL (mg/kg/d)	Test Species	Reference	Toxicity Value	LOAEL (mg/kg/d)	Test Species	Reference
Methoxychlor	--	8.00E+00	rat	Sample, et. al. (1996)	25.78 (chronic NOAEL)	1.29E+02	Japanese quail	LANL, 2005
Naphthalene	--	1.10E+02	mouse	EcoSSL (EPA, 2007)	553 (NOAEL)	2.77E+03	mallard duck	Based on B(a)P, Eisler (1987)
Phenanthrene	--	1.10E+02	mouse	EcoSSL (EPA, 2007)	553 (NOAEL)	2.77E+03	mallard duck	Based on B(a)P, Eisler (1987)
Pyrene	--	3.07E+00	mouse	EcoSSL (EPA, 2007)	553 (NOAEL)	2.77E+03	mallard duck	Based on B(a)P, Eisler (1987)
Inorganics								
Arsenic	--	1.26E+00	mouse	Sample, et al. (1996)	--	1.28E+01	mallard duck	Sample, et al. (1996)
Cadmium	--	1.00E+01	rat	Sample, et. al. (1996)	--	2.00E+01	mallard duck	Sample, et. al. (1996)
Chromium	2,737 (NOAEL)	1.37E+04	rat	Sample, et al. (1996)	--	2.78E+00	chicken, black duck, turkey	EcoSSL (EPA, 2007)
Copper	--	1.51E+01	mink	Sample, et al. (1996)	--	6.20E+01	chicks	Sample, et al. (1996)
Lead	--	8.00E+01	rat	Sample, et al. (1996)	3.85 (NOAEL)	1.93E+01	American kestrel	Sample, et al. (1996)
Mercury	1.0 (NOAEL)	5.00E+00	mink	Sample, et al. (1996)	--	9.00E-01	Japanese quail	Sample, et al. (1996)
Nickel	--	8.00E+01	rat	Sample, et al. (1996)	--	1.07E+02	mallard duck	Sample, et al. (1996)
Selenium	--	3.30E-01	rat	Sample, et. al. (1996)	--	1.00E+00	mallard duck	Sample, et. al. (1996)
Silver	--	2.22E+02	rat	ATSDR (1990)	178 (NOAEL)	8.90E+02	mallard duck	Terr. Tox. Database (USACHPPM, 2002)
Zinc	--	3.20E+02	rat	Sample, et al. (1996)	--	1.31E+02	hens	Sample et al. (1996)

N/A indicates that the information is not available.

As recommended by Wentsel, et. al. (1996), Tri-Service Procedural Guidelines for Ecological Risk Assessments, the following adjustments were made to toxicity data when NOAEL or LOAEL data were not available:

- Subchronic LOAELs were converted to chronic NOAELs by dividing by a factor of 20.
- Chronic NOAELs were converted to chronic LOAELs by multiplying by a factor of 5.0.
- Subchronic NOAELs/LOAELs were converted to chronic NOAELs/LOAELs by dividing by a factor of 10.
- Chronic LOAELs were converted to chronic NOAELs by dividing by a factor of 10.
- LD_{50} concentrations were converted to chronic NOAELs by dividing by a factor of 100.
- LD_{50} concentrations were converted to chronic LOAELs by dividing by a factor of 20.

Methodology for Selection of TRVs:

(1) Sample, et al., 1996, Toxicological Benchmarks for Wildlife.
(2) USEPA, 2007, Ecological Screening Levels (Eco-SSL). Low molecular weigh (LMW) PAH NOAELs based on Verschuuren et al., 1976; high molecular weight (HMW) PAH NOAELs based on Culp, et al., 1998; LMW LOAELs based on Murata et al., 1997; HMW PAH LOAELs based on Culp, et al., 1998.
(3) LANL (2005). Ecorisk Database, Release 2.2, September 2005, Los Alamos National Laboratory.
(4) Others as listed below:

ATSDR, 1990, Toxicological Profile for Silver, U.S. Public Health Service.
ATSDR, 1996, Toxicological Profile for 1,1,2,2-Tetrachloroethane, U.S. Public Health Service.
Eisler, 1987, PAH Hazards to Fish, Wildlife, and Invertebrates: A Synoptic Review.
TERRETOX, http://www.epa.gov/ecotox.
USACHPPM, 2002, Terrestrial Toxicity Database.
USEPA, 1999, SLERA Protocol for Hazardous Waste Combustion Facilties.
USEPA, 2000, OPP (Office of Pesticide Programs). Environmental Effects Database (EEDB).
USEPA, 2008, Integrated Risk Information System (IRIS).

Table F-28
Uncertainty Factors[a] for Ecological TRV[b] Extrapolations[c] at SWMUs 50 and 59
(Page 1 of 2)

Laboratory Animals (toxicity data base)		Selected Site Receptor Species	
Rat	G: *Rattus* F: Muridae O: Rodentia	Meadow vole	G: *Microtus* F: Muridae O: Rodentia
Mouse	G: *Mus* F: Muridae O: Rodentia	Short-tailed shrew	G: *Blarina* F: Soricidae O: Insectivora
Mink	G: *Mustela* F: Mustelidae O: Carnivora	American robin	G: *Turdus* F: Muscicapidae O: Passeriformes
Pheasant	G: *Phasianus* F: Phasianidae O: Galliformes	Red-tailed hawk	G: *Buteo* F: Accipitridae O: Ciconiiformes
American kestrel	G: *Falco* F: Falconidae O: Ciconiiformes	Red fox	G: *Vulpes* F: Canidae O: Carnivora
Chick, Hens Poultry	G: *Gallus* F: Phasianidae O: Galliformes		
Brown pelican	G: *Pelecanus* F: Pelicanidae O: Pelicaniformes		
Red-winged blackbird	G: *Agelaius* F: Icteridae O: Passeriformes		
Northern bobwhite	G: *Colinus* F: Odontophoridae O: Galliformes		
Black duck, Mallard	G: *Anas* F: Anatidae O: Anseriformes

Table F-28
Uncertainty Factors[a] for Ecological TRV[b] Extrapolations[c] at SWMUs 50 and 59

Laboratory Animals (toxicity data base)	
Japanese quail	G: *Coturnix* F: Phasianidae O: Galliformes
Gray partridge	G: *Perdix* F: Phasianidae O: Galliformes
Turkey	G: *Meleagris* F: Meleagrididae O: Galliformes

[a] From ***Tri-Service Procedural Guidelines for Ecological Risk Assessment*** (Wentsel et al. 1996)
[b] TRV = Toxicity Reference Value
[c] Interclass extrapolations not performed; only within bird class or within mammal class.

The Uncertainty Factors Used for TRV Extrapolations are Summarized Below:

- Extrapolation between two different species = uncertainty factor of 2
- Extrapolation between two different genera (G) = uncertainty factor of 4
- Extrapolation between two different families (F) or orders (O) = uncertainty factor of 8
- Thus, for all extrapolations used in the SLERA food chain model an uncertainty factor of 8 was used, except for:
    - rat or mouse toxicity values extrapolated to the meadow vole where an uncertainty factor of 4 was used; and

	75-01-4	Vinyl Chloride			mg/kg		0/14	4.90E-03 - 9.00E-03	9.00E-03	6.46E-01	3.00E-01	No

(1) Maximum non-detect limit value used for screening.

(2) Screening toxicity values from USEPA Eco SSLs (2009); Efroymson et al., PRGs (1997); and USEPA Region V EDQLs (1999); and other sources. See text for derivation.

(3) Screening toxicity values from USEPA Region III BTAG Screening Table (September, 1995).

Definitions: N/A = Not Applicable or Not Available
NVA = No Value Available

(1) Maximum non-detect limit value used for screening.

(2) Screening toxicity values from USEPA Eco SSLs (2009); Efroymson et al., PRGs (1997); and USEPA Region V EDQLs (1999); and other sources. See text for derivation.

(3) Screening toxicity values from USEPA Region III BTAG Screening Table (September, 1995).

Definitions: N/A = Not Applicable or Not Available
NVA = No Value Available

Table F-31
Selection of Ecological Soil Screening Toxicity Values for SWMUs 50 and 59

Parameter	Ecological Soil Screening Levels[a] (mg/kg)	Ecological Preliminary Remediation Goals[b] (mg/kg)	Ecological Data Quality Levels[c] (mg/kg)	Other Ecological Soil Screening Levels[d] (mg/kg)	Selected Ecological Screening Toxicity Value[e] (mg/kg)

a USEPA (2009), Ecological Soil Screening Level Guidance. Available on-line: http://www.epa.gov/ecotox/ecossl/

b Preliminary Remediation Goals for Ecological Endpoints, R. A. Efroymson, et. al., August 1997.

c Ecological Data Quality Levels, U.S.EPA Region 5, October 1999.

Table F-31
Selection of Ecological Soil Screening Toxicity Values for SWMUs 50 and 59

Parameter	Ecological Soil Screening Levels[a] (mg/kg)	Ecological Preliminary Remediation Goals[b] (mg/kg)	Ecological Data Quality Levels[c] (mg/kg)	Other Ecological Soil Screening Levels[d] (mg/kg)	Selected Ecological Screening Toxicity Value[e] (mg/kg)

d LANL (2005). Ecorisk Database Release 2.2, Los Alamos National Laboratory, September.

e The following hierarchy was utilized to select the final Ecological Screening Toxicity Values for this assessment:

1. The lower value of either the Ecological Soil Screening Level Guidance or the Preliminary Remediation Goals for Ecological Endpoints.
2. Ecological Data Quality Levels, U.S.EPA Region 5
3. If no other value is available, the selected ESL is from LANL, 2005.

NVA = No Value Available
